[39083] GAM1495 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1495 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1495 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1495 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39084] GAM1496 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1496 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1496 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1496 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39085] It is appreciated that specific functions, and accordingly utilities, of GR2885 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2885 gene: GAM1495 target protein and GAM1496 target protein, herein schematically represented by

GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1495 and GAM1496

- [39086] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2886 (GR2886) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [39087] GR2886 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2886 gene was detected is described hereinabove with reference to Figs. 6-15.
- [39088] GR2886 gene encodes GR2886 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [39089] GR2886 precursor RNA folds spatially, forming GR2886 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2886 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2886 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half

thereof, as is well known in the art.

- [39090] GR2886 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1497 precursor RNA and GAM1498 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [39091] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1497 RNA and GAM1498 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [39092] GAM1497 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1497 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1497 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1497 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.
- [39093] GAM1498 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1498 target RNA, herein schematically represented by GAM2 TARGET

RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1498 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1498 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39094] It is appreciated that specific functions, and accordingly utilities, of GR2886 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2886 gene: GAM1497 target protein and GAM1498 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1497 and GAM1498

[39095] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2887 (GR2887) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39096] GR2887 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2887 gene was detected is described hereinabove with reference to Figs. 6-15.

[39097] GR2887 gene encodes GR2887 precursor RNA, herein designated GR

PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39098] GR2887 precursor RNA folds spatially, forming GR2887 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2887 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2887 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39099] GR2887 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1519 precursor RNA and GAM1520 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39100] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1519 RNA and GAM1520 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39101] GAM1519 RNA, herein schematically represented by GAM1 binds

complimentarily to a target binding site located in an untranslated region of GAM1519 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1519 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1519 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39102] GAM1520 RNA, herein schematically represented by GAM2 binds complimentarily to a target binding site located in an untranslated region of GAM1520 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1520 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1520 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39103] It is appreciated that specific functions, and accordingly utilities, of GR2887 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2887 gene: GAM1519 target protein and GAM1520 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1519 and GAM1520

[39104] Fig. 16 further provides a conceptual description of novel bioinformatically

detected regulatory gene, referred to here as Genomic Record 2888(GR2888) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39105] GR2888 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2888 gene was detected is described hereinabove with reference to Figs. 6-15.

[39106] GR2888 gene encodes GR2888 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39107] GR2888 precursor RNA folds spatially, forming GR2888 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2888 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2888 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39108] GR2888 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1523 precursor RNA and

GAM1524 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39109] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1523 RNA and GAM1524 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39110] GAM1523 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1523 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1523 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1523 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39111] GAM1524 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1524 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1524 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1524 target protein, herein

schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39112] It is appreciated that specific functions, and accordingly utilities, of GR2888 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2888 gene: GAM1523 target protein and GAM1524 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1523 and GAM1524

[39113] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2889 (GR2889) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39114] GR2889 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2889 gene was detected is described hereinabove with reference to Figs. 6-15.

[39115] GR2889 gene encodes GR2889 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39116] GR2889 precursor RNA folds spatially, forming GR2889 folded precursor

RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2889 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2889 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39117] GR2889 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1526 precursor RNA and GAM1527 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39118] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1526 RNA and GAM1527 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39119] GAM1526 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1526 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1526 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1526 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39120] GAM1527 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1527 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1527 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1527 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39121] It is appreciated that specific functions, and accordingly utilities, of GR2889 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2889 gene: GAM1526 target protein and GAM1527 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1526 and GAM1527

[39122] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2890 (GR2890) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one

target gene, the function and utility of which at least one target gene is known in the art.

[39123] GR2890 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2890 gene was detected is described hereinabove with reference to Figs. 6-15.

[39124] GR2890 gene encodes GR2890 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39125] GR2890 precursor RNA folds spatially, forming GR2890 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2890 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2890 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39126] GR2890 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1531 precursor RNA and GAM1532 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to

## GAM PRECURSOR RNA of Fig. 8.

[39127] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1531 RNA and GAM1532 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39128] GAM1531 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1531 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1531 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1531 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39129] GAM1532 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1532 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1532 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1532 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39130] It is appreciated that specific functions, and accordingly utilities, of GR2890 gene, herein designated GR GENE, correlate with, and may be deduced

from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2890 gene: GAM1531 target protein and GAM1532 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1531 and GAM1532

[39131] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2891 (GR2891) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39132] GR2891 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2891 gene was detected is described hereinabove with reference to Figs. 6-15.

[39133] GR2891 gene encodes GR2891 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39134] GR2891 precursor RNA folds spatially, forming GR2891 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2891 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the

nucleotide sequence of GR2891 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

- [39135] GR2891 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1534 precursor RNA and GAM1535 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [39136] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1534 RNA and GAM1535 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [39137] GAM1534 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1534 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1534 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1534 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39138] GAM1535 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1535 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1535 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1535 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39139] It is appreciated that specific functions, and accordingly utilities, of GR2891 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2891 gene: GAM1534 target protein and GAM1535 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1534 and GAM1535

[39140] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2892 (GR2892) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39141] GR2892 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which

GR2892 gene was detected is described hereinabove with reference to Figs. 6-15.

[39142] GR2892 gene encodes GR2892 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39143] GR2892 precursor RNA folds spatially, forming GR2892 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2892 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2892 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39144] GR2892 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1537 precursor RNA and GAM1538 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39145] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1537 RNA and GAM1538 RNA respectively, herein

schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39146] GAM1537 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1537 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1537 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1537 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39147] GAM1538 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1538 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1538 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1538 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39148] It is appreciated that specific functions, and accordingly utilities, of GR2892 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2892 gene: GAM1537 target protein and GAM1538 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The

function of these target genes is elaborated hereinabove with reference to GAM1537 and GAM1538

- [39149] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2893 (GR2893) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [39150] GR2893 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2893 gene was detected is described hereinabove with reference to Figs. 6-15.
- [39151] GR2893 gene encodes GR2893 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [39152] GR2893 precursor RNA folds spatially, forming GR2893 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2893 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2893 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

- [39153] GR2893 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1552 precursor RNA and GAM1553 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [39154] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1552 RNA and GAM1553 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [39155] GAM1552 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1552 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1552 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1552 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.
- [39156] GAM1553 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1553 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1553 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1553 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39157] It is appreciated that specific functions, and accordingly utilities, of GR2893 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2893 gene: GAM1552 target protein and GAM1553 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1552 and GAM1553

[39158] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2894 (GR2894) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39159] GR2894 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2894 gene was detected is described hereinabove with reference to Figs. 6-15.

[39160] GR2894 gene encodes GR2894 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides

long.

[39161] GR2894 precursor RNA folds spatially, forming GR2894 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2894 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2894 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39162] GR2894 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1558 precursor RNA and GAM1559 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39163] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1558 RNA and GAM1559 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39164] GAM1558 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of

GAM1558 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1558 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1558 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39165] GAM1559 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1559 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1559 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1559 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39166] It is appreciated that specific functions, and accordingly utilities, of GR2894 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2894 gene: GAM1558 target protein and GAM1559 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1558 and GAM1559

[39167] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record

2895(GR2895) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39168] GR2895 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2895 gene was detected is described hereinabove with reference to Figs. 6-15.

[39169] GR2895 gene encodes GR2895 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39170] GR2895 precursor RNA folds spatially, forming GR2895 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2895 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2895 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39171] GR2895 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1564 precursor RNA and GAM1565 precursor RNA, herein schematically represented by GAM1

PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39172] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1564 RNA and GAM1565 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39173] GAM1564 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1564 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1564 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1564 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39174] GAM1565 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1565 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1565 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1565 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39175] It is appreciated that specific functions, and accordingly utilities, of GR2895 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2895 gene: GAM1564 target protein and GAM1565 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1564 and GAM1565

[39176] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2896 (GR2896) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39177] GR2896 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2896 gene was detected is described hereinabove with reference to Figs. 6-15.

[39178] GR2896 gene encodes GR2896 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39179] GR2896 precursor RNA folds spatially, forming GR2896 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2896 folded precursor RNA, herein designated GR FOLDED

PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2896 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39180] GR2896 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1567 precursor RNA and GAM1568 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39181] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1567 RNA and GAM1568 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39182] GAM1567 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1567 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1567 target RNA, herein schematically

represented by GAM1 TARGET RNA into GAM1567 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39183] GAM1568 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1568 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1568 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1568 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39184] It is appreciated that specific functions, and accordingly utilities, of GR2896 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2896 gene: GAM1567 target protein and GAM1568 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1567 and GAM1568

[39185] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2897 (GR2897) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39186] GR2897 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2897 gene was detected is described hereinabove with reference to Figs. 6-15.

[39187] GR2897 gene encodes GR2897 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39188] GR2897 precursor RNA folds spatially, forming GR2897 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2897 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2897 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39189] GR2897 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1569 precursor RNA and GAM1570 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39190] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX

of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1569 RNA and GAM1570 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39191] GAM1569 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1569 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1569 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1569 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39192] GAM1570 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1570 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1570 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1570 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39193] It is appreciated that specific functions, and accordingly utilities, of GR2897 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2897 gene: GAM1569 target

protein and GAM1570 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1569 and GAM1570

[39194] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2898 (GR2898) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39195] GR2898 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2898 gene was detected is described hereinabove with reference to Figs. 6-15.

[39196] GR2898 gene encodes GR2898 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39197] GR2898 precursor RNA folds spatially, forming GR2898 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2898 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2898 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence

which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39198] GR2898 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1573 precursor RNA and GAM1574 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39199] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1573 RNA and GAM1574 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39200] GAM1573 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1573 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1573 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1573 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39201] GAM1574 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of

GAM1574 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1574 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1574 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39202] It is appreciated that specific functions, and accordingly utilities, of GR2898 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2898 gene: GAM1573 target protein and GAM1574 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1573 and GAM1574

[39203] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2899 (GR2899) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39204] GR2899 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2899 gene was detected is described hereinabove with reference to Figs. 6-15.

- [39205] GR2899 gene encodes GR2899 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [39206] GR2899 precursor RNA folds spatially, forming GR2899 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2899 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2899 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.
- [39207] GR2899 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1576 precursor RNA and GAM1577 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [39208] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1576 RNA and GAM1577 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39209] GAM1576 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1576 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1576 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1576 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39210] GAM1577 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1577 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1577 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1577 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39211] It is appreciated that specific functions, and accordingly utilities, of GR2899 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2899 gene: GAM1576 target protein and GAM1577 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1576 and GAM1577

- [39212] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2900 (GR2900) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [39213] GR2900 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2900 gene was detected is described hereinabove with reference to Figs. 6-15.
- [39214] GR2900 gene encodes GR2900 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [39215] GR2900 precursor RNA folds spatially, forming GR2900 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2900 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2900 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.
- [39216] GR2900 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into

at least 2 separate GAM precursor RNAs, GAM1583 precursor RNA and GAM1584 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39217] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1583 RNA and GAM1584 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39218] GAM1583 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1583 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1583 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1583 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39219] GAM1584 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1584 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1584 target RNA, herein schematically

represented by GAM2 TARGET RNA into GAM1584 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39220] It is appreciated that specific functions, and accordingly utilities, of GR2900 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2900 gene: GAM1583 target protein and GAM1584 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1583 and GAM1584

[39221] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2901 (GR2901) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39222] GR2901 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2901 gene was detected is described hereinabove with reference to Figs. 6-15.

[39223] GR2901 gene encodes GR2901 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39224] GR2901 precursor RNA folds spatially, forming GR2901 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2901 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2901 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39225] GR2901 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM1586 precursor RNA, GAM1587 precursor RNA and GAM1588 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR and GAM3 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39226] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1586 RNA, GAM1587 RNA and GAM1588 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA and GAM3 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39227] GAM1586 RNA, herein schematically represented by GAM1 binds

complimentarily to a target binding site located in an untranslated region of GAM1586 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1586 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1586 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39228] GAM1587 RNA, herein schematically represented by GAM2 binds complimentarily to a target binding site located in an untranslated region of GAM1587 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1587 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1587 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39229] GAM1588 RNA, herein schematically represented by GAM3 binds complimentarily to a target binding site located in an untranslated region of GAM1588 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1588 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM1588 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[39230] It is appreciated that specific functions, and accordingly utilities, of GR2901

gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2901 gene: GAM1586 target protein, GAM1587 target protein and GAM1588 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1586, GAM1587 and GAM1588

[39231] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2902(GR2902) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39232] GR2902 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2902 gene was detected is described hereinabove with reference to Figs. 6-15.

[39233] GR2902 gene encodes GR2902 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39234] GR2902 precursor RNA folds spatially, forming GR2902 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2902 folded precursor RNA, herein designated GR FOLDED

PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2902 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39235] GR2902 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1594 precursor RNA and GAM1595 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39236] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1594 RNA and GAM1595 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39237] GAM1594 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1594 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1594 target RNA, herein schematically

represented by GAM1 TARGET RNA into GAM1594 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39238] GAM1595 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1595 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1595 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1595 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39239] It is appreciated that specific functions, and accordingly utilities, of GR2902 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2902 gene: GAM1594 target protein and GAM1595 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1594 and GAM1595

[39240] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2903 (GR2903) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

- [39241] GR2903 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2903 gene was detected is described hereinabove with reference to Figs. 6-15.
- [39242] GR2903 gene encodes GR2903 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [39243] GR2903 precursor RNA folds spatially, forming GR2903 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2903 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2903 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.
- [39244] GR2903 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 4 separate GAM precursor RNAs, GAM1596 precursor RNA, GAM1597 precursor RNA, GAM1598 precursor RNA and GAM1599 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR, GAM3 PRECURSOR and GAM4 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39245] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1596 RNA, GAM1597 RNA, GAM1598 RNA and GAM1599 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA, GAM3 RNA and GAM4 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39246] GAM1596 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1596 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1596 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1596 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39247] GAM1597 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1597 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1597 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1597 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39248] GAM1598 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of

GAM1598 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1598 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM1598 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[39249] GAM1599 RNA, herein schematically represented by GAM4 binds complementarily to a target binding site located in an untranslated region of GAM1599 target RNA, herein schematically represented by GAM4 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1599 target RNA, herein schematically represented by GAM4 TARGET RNA into GAM1599 target protein, herein schematically represented by GAM4 TARGET PROTEIN, both of Fig. 8.

[39250] It is appreciated that specific functions, and accordingly utilities, of GR2903 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2903 gene: GAM1596 target protein, GAM1597 target protein, GAM1598 target protein and GAM1599 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1596, GAM1597, GAM1598 and GAM1599

[39251] Fig. 16 further provides a conceptual description of novel bioinformatically

detected regulatory gene, referred to here as Genomic Record 2904 (GR2904) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39252] GR2904 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2904 gene was detected is described hereinabove with reference to Figs. 6-15.

[39253] GR2904 gene encodes GR2904 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39254] GR2904 precursor RNA folds spatially, forming GR2904 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2904 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2904 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39255] GR2904 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1607 precursor RNA and

GAM1608 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39256] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1607 RNA and GAM1608 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39257] GAM1607 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1607 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1607 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1607 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39258] GAM1608 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1608 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1608 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1608 target protein, herein

schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39259] It is appreciated that specific functions, and accordingly utilities, of GR2904 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2904 gene: GAM1607 target protein and GAM1608 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1607 and GAM1608

[39260] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2905 (GR2905) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39261] GR2905 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2905 gene was detected is described hereinabove with reference to Figs. 6-15.

[39262] GR2905 gene encodes GR2905 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39263] GR2905 precursor RNA folds spatially, forming GR2905 folded precursor

RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2905 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2905 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39264] GR2905 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1612 precursor RNA and GAM1613 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39265] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1612 RNA and GAM1613 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39266] GAM1612 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1612 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1612 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1612 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39267] GAM1613 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1613 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1613 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1613 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39268] It is appreciated that specific functions, and accordingly utilities, of GR2905 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2905 gene: GAM1612 target protein and GAM1613 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1612 and GAM1613

[39269] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2906 (GR2906) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one

target gene, the function and utility of which at least one target gene is known in the art.

[39270] GR2906 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2906 gene was detected is described hereinabove with reference to Figs. 6-15.

[39271] GR2906 gene encodes GR2906 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39272] GR2906 precursor RNA folds spatially, forming GR2906 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2906 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2906 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39273] GR2906 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1616 precursor RNA and GAM1617 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to

GAM PRECURSOR RNA of Fig. 8.

[39274] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1616 RNA and GAM1617 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39275] GAM1616 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1616 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1616 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1616 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39276] GAM1617 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1617 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1617 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1617 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39277] It is appreciated that specific functions, and accordingly utilities, of GR2906 gene, herein designated GR GENE, correlate with, and may be deduced

from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2906 gene: GAM1616 target protein and GAM1617 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1616 and GAM1617

[39278] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2907 (GR2907) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39279] GR2907 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2907 gene was detected is described hereinabove with reference to Figs. 6-15.

[39280] GR2907 gene encodes GR2907 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39281] GR2907 precursor RNA folds spatially, forming GR2907 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2907 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the

nucleotide sequence of GR2907 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39282] GR2907 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1618 precursor RNA and GAM1619 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39283] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1618 RNA and GAM1619 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39284] GAM1618 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1618 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1618 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1618 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39285] GAM1619 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1619 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1619 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1619 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39286] It is appreciated that specific functions, and accordingly utilities, of GR2907 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2907 gene: GAM1618 target protein and GAM1619 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1618 and GAM1619

[39287] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2908 (GR2908) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39288] GR2908 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which

GR2908 gene was detected is described hereinabove with reference to Figs. 6-15.

[39289] GR2908 gene encodes GR2908 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39290] GR2908 precursor RNA folds spatially, forming GR2908 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2908 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2908 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39291] GR2908 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1620 precursor RNA and GAM1621 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39292] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1620 RNA and GAM1621 RNA respectively, herein

schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39293] GAM1620 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1620 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1620 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1620 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39294] GAM1621 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1621 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1621 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1621 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39295] It is appreciated that specific functions, and accordingly utilities, of GR2908 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2908 gene: GAM1620 target protein and GAM1621 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The

function of these target genes is elaborated hereinabove with reference to GAM1620 and GAM1621

- [39296] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2909 (GR2909) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [39297] GR2909 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2909 gene was detected is described hereinabove with reference to Figs. 6-15.
- [39298] GR2909 gene encodes GR2909 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [39299] GR2909 precursor RNA folds spatially, forming GR2909 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2909 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2909 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

- [39300] GR2909 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1626 precursor RNA and GAM1627 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [39301] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1626 RNA and GAM1627 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [39302] GAM1626 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1626 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1626 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1626 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.
- [39303] GAM1627 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1627 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1627 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1627 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39304] It is appreciated that specific functions, and accordingly utilities, of GR2909 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2909 gene: GAM1626 target protein and GAM1627 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1626 and GAM1627

[39305] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2910 (GR2910) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39306] GR2910 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2910 gene was detected is described hereinabove with reference to Figs. 6-15.

[39307] GR2910 gene encodes GR2910 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides

long.

[39308] GR2910 precursor RNA folds spatially, forming GR2910 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2910 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2910 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39309] GR2910 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1630 precursor RNA and GAM1631 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39310] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1630 RNA and GAM1631 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39311] GAM1630 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of

GAM1630 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1630 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1630 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39312] GAM1631 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1631 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1631 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1631 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39313] It is appreciated that specific functions, and accordingly utilities, of GR2910 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2910 gene: GAM1630 target protein and GAM1631 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1630 and GAM1631

[39314] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record

2911(GR2911) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39315] GR2911 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2911 gene was detected is described hereinabove with reference to Figs. 6-15.

[39316] GR2911 gene encodes GR2911 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39317] GR2911 precursor RNA folds spatially, forming GR2911 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2911 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2911 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39318] GR2911 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1636 precursor RNA and GAM1637 precursor RNA, herein schematically represented by GAM1

PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39319] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1636 RNA and GAM1637 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39320] GAM1636 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1636 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1636 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1636 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39321] GAM1637 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1637 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1637 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1637 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39322] It is appreciated that specific functions, and accordingly utilities, of GR2911 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2911 gene: GAM1636 target protein and GAM1637 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1636 and GAM1637

[39323] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2912 (GR2912) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39324] GR2912 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2912 gene was detected is described hereinabove with reference to Figs. 6-15.

[39325] GR2912 gene encodes GR2912 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39326] GR2912 precursor RNA folds spatially, forming GR2912 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2912 folded precursor RNA, herein designated GR FOLDED

PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2912 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39327] GR2912 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1643 precursor RNA and GAM1644 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39328] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1643 RNA and GAM1644 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39329] GAM1643 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1643 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1643 target RNA, herein schematically

represented by GAM1 TARGET RNA into GAM1643 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39330] GAM1644 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1644 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1644 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1644 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39331] It is appreciated that specific functions, and accordingly utilities, of GR2912 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2912 gene: GAM1643 target protein and GAM1644 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1643 and GAM1644

[39332] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2913 (GR2913) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39333] GR2913 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2913 gene was detected is described hereinabove with reference to Figs. 6-15.

[39334] GR2913 gene encodes GR2913 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39335] GR2913 precursor RNA folds spatially, forming GR2913 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2913 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2913 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39336] GR2913 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM1650 precursor RNA, GAM1651 precursor RNA and GAM1652 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR and GAM3 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39337] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1650 RNA, GAM1651 RNA and GAM1652 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA and GAM3 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39338] GAM1650 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1650 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1650 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1650 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39339] GAM1651 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1651 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1651 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1651 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39340] GAM1652 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of

GAM1652 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1652 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM1652 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[39341] It is appreciated that specific functions, and accordingly utilities, of GR2913 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2913 gene: GAM1650 target protein, GAM1651 target protein and GAM1652 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1650, GAM1651 and GAM1652

[39342] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2914(GR2914) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39343] GR2914 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2914 gene was detected is described hereinabove with reference to Figs.

- [39344] GR2914 gene encodes GR2914 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [39345] GR2914 precursor RNA folds spatially, forming GR2914 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2914 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2914 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.
- [39346] GR2914 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1662 precursor RNA and GAM1663 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [39347] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1662 RNA and GAM1663 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively,

each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39348] GAM1662 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1662 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1662 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1662 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39349] GAM1663 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1663 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1663 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1663 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39350] It is appreciated that specific functions, and accordingly utilities, of GR2914 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2914 gene: GAM1662 target protein and GAM1663 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to

- [39351] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2915(GR2915) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [39352] GR2915 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2915 gene was detected is described hereinabove with reference to Figs. 6-15.
- [39353] GR2915 gene encodes GR2915 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [39354] GR2915 precursor RNA folds spatially, forming GR2915 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2915 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2915 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

- [39355] GR2915 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1670 precursor RNA and GAM1671 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [39356] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1670 RNA and GAM1671 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [39357] GAM1670 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1670 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1670 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1670 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.
- [39358] GAM1671 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1671 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1671 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1671 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39359] It is appreciated that specific functions, and accordingly utilities, of GR2915 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2915 gene: GAM1670 target protein and GAM1671 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1670 and GAM1671

[39360] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2916 (GR2916) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39361] GR2916 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2916 gene was detected is described hereinabove with reference to Figs. 6-15.

[39362] GR2916 gene encodes GR2916 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides

long.

[39363] GR2916 precursor RNA folds spatially, forming GR2916 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2916 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2916 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39364] GR2916 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1674 precursor RNA and GAM1675 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39365] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1674 RNA and GAM1675 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39366] GAM1674 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of

GAM1674 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1674 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1674 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39367] GAM1675 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1675 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1675 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1675 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39368] It is appreciated that specific functions, and accordingly utilities, of GR2916 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2916 gene: GAM1674 target protein and GAM1675 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1674 and GAM1675

[39369] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record

2917(GR2917) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39370] GR2917 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2917 gene was detected is described hereinabove with reference to Figs. 6-15.

[39371] GR2917 gene encodes GR2917 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39372] GR2917 precursor RNA folds spatially, forming GR2917 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2917 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2917 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39373] GR2917 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1678 precursor RNA and GAM1679 precursor RNA, herein schematically represented by GAM1

PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39374] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1678 RNA and GAM1679 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39375] GAM1678 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1678 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1678 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1678 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39376] GAM1679 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1679 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1679 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1679 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39377] It is appreciated that specific functions, and accordingly utilities, of GR2917 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2917 gene: GAM1678 target protein and GAM1679 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1678 and GAM1679

[39378] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2918 (GR2918) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39379] GR2918 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2918 gene was detected is described hereinabove with reference to Figs. 6-15.

[39380] GR2918 gene encodes GR2918 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39381] GR2918 precursor RNA folds spatially, forming GR2918 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2918 folded precursor RNA, herein designated GR FOLDED

PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2918 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39382] GR2918 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1681 precursor RNA and GAM1682 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39383] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1681 RNA and GAM1682 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39384] GAM1681 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1681 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1681 target RNA, herein schematically

represented by GAM1 TARGET RNA into GAM1681 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39385] GAM1682 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1682 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1682 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1682 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39386] It is appreciated that specific functions, and accordingly utilities, of GR2918 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2918 gene: GAM1681 target protein and GAM1682 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1681 and GAM1682

[39387] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2919 (GR2919) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39388] GR2919 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2919 gene was detected is described hereinabove with reference to Figs. 6-15.

[39389] GR2919 gene encodes GR2919 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39390] GR2919 precursor RNA folds spatially, forming GR2919 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2919 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2919 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39391] GR2919 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1686 precursor RNA and GAM1687 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39392] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX

of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1686 RNA and GAM1687 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39393] GAM1686 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1686 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1686 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1686 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39394] GAM1687 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1687 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1687 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1687 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39395] It is appreciated that specific functions, and accordingly utilities, of GR2919 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2919 gene: GAM1686 target

protein and GAM1687 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1686 and GAM1687

[39396] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2920 (GR2920) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39397] GR2920 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2920 gene was detected is described hereinabove with reference to Figs. 6-15.

[39398] GR2920 gene encodes GR2920 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39399] GR2920 precursor RNA folds spatially, forming GR2920 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2920 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2920 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence

which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39400] GR2920 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM1695 precursor RNA, GAM1696 precursor RNA and GAM1697 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR and GAM3 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39401] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1695 RNA, GAM1696 RNA and GAM1697 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA and GAM3 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39402] GAM1695 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1695 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1695 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1695 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

- [39403] GAM1696 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1696 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1696 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1696 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.
- [39404] GAM1697 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of GAM1697 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1697 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM1697 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.
- [39405] It is appreciated that specific functions, and accordingly utilities, of GR2920 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2920 gene: GAM1695 target protein, GAM1696 target protein and GAM1697 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1695, GAM1696 and GAM1697

- [39406] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2921 (GR2921) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [39407] GR2921 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2921 gene was detected is described hereinabove with reference to Figs. 6-15.
- [39408] GR2921 gene encodes GR2921 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [39409] GR2921 precursor RNA folds spatially, forming GR2921 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2921 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2921 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.
- [39410] GR2921 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into

at least 2 separate GAM precursor RNAs, GAM1699 precursor RNA and GAM1700 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39411] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1699 RNA and GAM1700 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39412] GAM1699 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1699 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1699 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1699 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39413] GAM1700 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1700 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1700 target RNA, herein schematically

represented by GAM2 TARGET RNA into GAM1700 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39414] It is appreciated that specific functions, and accordingly utilities, of GR2921 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2921 gene: GAM1699 target protein and GAM1700 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1699 and GAM1700

[39415] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2922 (GR2922) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39416] GR2922 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2922 gene was detected is described hereinabove with reference to Figs. 6-15.

[39417] GR2922 gene encodes GR2922 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39418] GR2922 precursor RNA folds spatially, forming GR2922 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2922 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2922 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39419] GR2922 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1704 precursor RNA and GAM1705 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39420] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1704 RNA and GAM1705 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39421] GAM1704 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1704 target RNA, herein schematically represented by GAM1 TARGET

RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1704 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1704 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39422] GAM1705 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1705 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1705 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1705 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39423] It is appreciated that specific functions, and accordingly utilities, of GR2922 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2922 gene: GAM1704 target protein and GAM1705 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1704 and GAM1705

[39424] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2923(GR2923) gene, which encodes an operon-like cluster of novel micro

RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39425] GR2923 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2923 gene was detected is described hereinabove with reference to Figs. 6-15.

[39426] GR2923 gene encodes GR2923 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39427] GR2923 precursor RNA folds spatially, forming GR2923 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2923 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2923 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39428] GR2923 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1708 precursor RNA and GAM1709 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM

precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39429] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1708 RNA and GAM1709 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39430] GAM1708 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1708 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1708 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1708 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39431] GAM1709 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1709 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1709 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1709 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39432] It is appreciated that specific functions, and accordingly utilities, of GR2923

gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2923 gene: GAM1708 target protein and GAM1709 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1708 and GAM1709

[39433] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2924 (GR2924) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39434] GR2924 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2924 gene was detected is described hereinabove with reference to Figs. 6-15.

[39435] GR2924 gene encodes GR2924 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39436] GR2924 precursor RNA folds spatially, forming GR2924 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2924 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as

hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2924 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39437] GR2924 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM1712 precursor RNA, GAM1713 precursor RNA and GAM1714 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR and GAM3 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39438] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1712 RNA, GAM1713 RNA and GAM1714 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA and GAM3 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39439] GAM1712 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1712 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby

inhibiting translation of GAM1712 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1712 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39440] GAM1713 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1713 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1713 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1713 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39441] GAM1714 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of GAM1714 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1714 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM1714 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[39442] It is appreciated that specific functions, and accordingly utilities, of GR2924 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2924 gene: GAM1712 target protein, GAM1713 target protein and GAM1714 target protein, herein

schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1712, GAM1713 and GAM1714

- [39443] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2925(GR2925) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [39444] GR2925 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2925 gene was detected is described hereinabove with reference to Figs. 6-15.
- [39445] GR2925 gene encodes GR2925 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [39446] GR2925 precursor RNA folds spatially, forming GR2925 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2925 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2925 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence

which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39447] GR2925 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM1715 precursor RNA, GAM1716 precursor RNA and GAM1717 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR and GAM3 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39448] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1715 RNA, GAM1716 RNA and GAM1717 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA and GAM3 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39449] GAM1715 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1715 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1715 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1715 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39450] GAM1716 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1716 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1716 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1716 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39451] GAM1717 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of GAM1717 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1717 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM1717 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[39452] It is appreciated that specific functions, and accordingly utilities, of GR2925 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2925 gene: GAM1715 target protein, GAM1716 target protein and GAM1717 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1715, GAM1716 and GAM1717

- [39453] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2926(GR2926) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [39454] GR2926 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2926 gene was detected is described hereinabove with reference to Figs. 6-15.
- [39455] GR2926 gene encodes GR2926 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [39456] GR2926 precursor RNA folds spatially, forming GR2926 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2926 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2926 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.
- [39457] GR2926 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into

at least 2 separate GAM precursor RNAs, GAM1718 precursor RNA and GAM1719 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39458] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1718 RNA and GAM1719 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39459] GAM1718 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1718 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1718 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1718 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39460] GAM1719 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1719 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1719 target RNA, herein schematically

represented by GAM2 TARGET RNA into GAM1719 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39461] It is appreciated that specific functions, and accordingly utilities, of GR2926 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2926 gene: GAM1718 target protein and GAM1719 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1718 and GAM1719

[39462] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2927 (GR2927) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39463] GR2927 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2927 gene was detected is described hereinabove with reference to Figs. 6-15.

[39464] GR2927 gene encodes GR2927 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39465] GR2927 precursor RNA folds spatially, forming GR2927 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2927 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2927 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39466] GR2927 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1723 precursor RNA and GAM1724 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39467] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1723 RNA and GAM1724 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39468] GAM1723 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1723 target RNA, herein schematically represented by GAM1 TARGET

RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1723 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1723 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39469] GAM1724 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1724 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1724 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1724 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39470] It is appreciated that specific functions, and accordingly utilities, of GR2927 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2927 gene: GAM1723 target protein and GAM1724 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1723 and GAM1724

[39471] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2928(GR2928) gene, which encodes an operon-like cluster of novel micro

RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39472] GR2928 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2928 gene was detected is described hereinabove with reference to Figs. 6-15.

[39473] GR2928 gene encodes GR2928 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39474] GR2928 precursor RNA folds spatially, forming GR2928 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2928 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2928 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39475] GR2928 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 4 separate GAM precursor RNAs, GAM1735 precursor RNA, GAM1736 precursor RNA, GAM1737 precursor RNA and GAM1738 precursor RNA, herein schematically represented by GAM1 PRECURSOR,

GAM2 PRECURSOR, GAM3 PRECURSOR and GAM4 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39476] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1735 RNA, GAM1736 RNA, GAM1737 RNA and GAM1738 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA, GAM3 RNA and GAM4 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39477] GAM1735 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1735 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1735 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1735 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39478] GAM1736 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1736 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1736 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1736 target protein, herein

schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39479] GAM1737 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of GAM1737 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1737 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM1737 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[39480] GAM1738 RNA, herein schematically represented by GAM4 binds complementarily to a target binding site located in an untranslated region of GAM1738 target RNA, herein schematically represented by GAM4 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1738 target RNA, herein schematically represented by GAM4 TARGET RNA into GAM1738 target protein, herein schematically represented by GAM4 TARGET PROTEIN, both of Fig. 8.

[39481] It is appreciated that specific functions, and accordingly utilities, of GR2928 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2928 gene: GAM1735 target protein, GAM1736 target protein, GAM1737 target protein and GAM1738 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of

these target genes is elaborated hereinabove with reference to GAM1735, GAM1736, GAM1737 and GAM1738

- [39482] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2929(GR2929) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [39483] GR2929 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2929 gene was detected is described hereinabove with reference to Figs. 6-15.
- [39484] GR2929 gene encodes GR2929 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [39485] GR2929 precursor RNA folds spatially, forming GR2929 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2929 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2929 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

- [39486] GR2929 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1744 precursor RNA and GAM1745 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [39487] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1744 RNA and GAM1745 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [39488] GAM1744 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1744 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1744 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1744 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.
- [39489] GAM1745 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1745 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1745 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1745 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39490] It is appreciated that specific functions, and accordingly utilities, of GR2929 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2929 gene: GAM1744 target protein and GAM1745 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1744 and GAM1745

[39491] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2930 (GR2930) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39492] GR2930 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2930 gene was detected is described hereinabove with reference to Figs. 6-15.

[39493] GR2930 gene encodes GR2930 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides

long.

[39494] GR2930 precursor RNA folds spatially, forming GR2930 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2930 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2930 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39495] GR2930 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1749 precursor RNA and GAM1750 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39496] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1749 RNA and GAM1750 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39497] GAM1749 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of

GAM1749 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1749 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1749 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39498] GAM1750 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1750 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1750 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1750 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39499] It is appreciated that specific functions, and accordingly utilities, of GR2930 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2930 gene: GAM1749 target protein and GAM1750 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1749 and GAM1750

[39500] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record

2931(GR2931) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39501] GR2931 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2931 gene was detected is described hereinabove with reference to Figs. 6-15.

[39502] GR2931 gene encodes GR2931 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39503] GR2931 precursor RNA folds spatially, forming GR2931 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2931 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2931 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39504] GR2931 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1751 precursor RNA and GAM1752 precursor RNA, herein schematically represented by GAM1

PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39505] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1751 RNA and GAM1752 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39506] GAM1751 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1751 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1751 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1751 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39507] GAM1752 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1752 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1752 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1752 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39508] It is appreciated that specific functions, and accordingly utilities, of GR2931 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2931 gene: GAM1751 target protein and GAM1752 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1751 and GAM1752

[39509] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2932 (GR2932) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39510] GR2932 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2932 gene was detected is described hereinabove with reference to Figs. 6-15.

[39511] GR2932 gene encodes GR2932 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39512] GR2932 precursor RNA folds spatially, forming GR2932 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2932 folded precursor RNA, herein designated GR FOLDED

PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2932 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39513] GR2932 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1755 precursor RNA and GAM1756 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39514] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1755 RNA and GAM1756 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39515] GAM1755 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1755 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1755 target RNA, herein schematically

represented by GAM1 TARGET RNA into GAM1755 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39516] GAM1756 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1756 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1756 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1756 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39517] It is appreciated that specific functions, and accordingly utilities, of GR2932 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2932 gene: GAM1755 target protein and GAM1756 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1755 and GAM1756

[39518] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2933 (GR2933) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39519] GR2933 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2933 gene was detected is described hereinabove with reference to Figs. 6-15.

[39520] GR2933 gene encodes GR2933 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39521] GR2933 precursor RNA folds spatially, forming GR2933 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2933 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2933 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39522] GR2933 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1761 precursor RNA and GAM1762 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39523] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX

of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1761 RNA and GAM1762 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39524] GAM1761 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1761 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1761 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1761 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39525] GAM1762 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1762 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1762 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1762 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39526] It is appreciated that specific functions, and accordingly utilities, of GR2933 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2933 gene: GAM1761 target

protein and GAM1762 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1761 and GAM1762

[39527] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2934 (GR2934) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39528] GR2934 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2934 gene was detected is described hereinabove with reference to Figs. 6-15.

[39529] GR2934 gene encodes GR2934 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39530] GR2934 precursor RNA folds spatially, forming GR2934 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2934 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2934 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence

which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39531] GR2934 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1764 precursor RNA and GAM1765 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39532] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1764 RNA and GAM1765 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39533] GAM1764 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1764 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1764 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1764 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39534] GAM1765 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of

GAM1765 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1765 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1765 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39535] It is appreciated that specific functions, and accordingly utilities, of GR2934 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2934 gene: GAM1764 target protein and GAM1765 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1764 and GAM1765

[39536] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2935 (GR2935) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39537] GR2935 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2935 gene was detected is described hereinabove with reference to Figs. 6-15.

[39538] GR2935 gene encodes GR2935 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39539] GR2935 precursor RNA folds spatially, forming GR2935 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2935 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2935 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39540] GR2935 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1768 precursor RNA and GAM1769 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39541] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1768 RNA and GAM1769 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39542] GAM1768 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1768 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1768 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1768 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39543] GAM1769 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1769 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1769 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1769 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39544] It is appreciated that specific functions, and accordingly utilities, of GR2935 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2935 gene: GAM1768 target protein and GAM1769 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1768 and GAM1769

- [39545] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2936 (GR2936) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [39546] GR2936 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2936 gene was detected is described hereinabove with reference to Figs. 6-15.
- [39547] GR2936 gene encodes GR2936 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [39548] GR2936 precursor RNA folds spatially, forming GR2936 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2936 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2936 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.
- [39549] GR2936 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into

at least 2 separate GAM precursor RNAs, GAM1775 precursor RNA and GAM1776 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39550] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1775 RNA and GAM1776 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39551] GAM1775 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1775 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1775 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1775 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39552] GAM1776 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1776 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1776 target RNA, herein schematically

represented by GAM2 TARGET RNA into GAM1776 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39553] It is appreciated that specific functions, and accordingly utilities, of GR2936 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2936 gene: GAM1775 target protein and GAM1776 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1775 and GAM1776

[39554] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2937 (GR2937) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39555] GR2937 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2937 gene was detected is described hereinabove with reference to Figs. 6-15.

[39556] GR2937 gene encodes GR2937 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39557] GR2937 precursor RNA folds spatially, forming GR2937 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2937 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2937 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39558] GR2937 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1777 precursor RNA and GAM1778 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39559] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1777 RNA and GAM1778 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39560] GAM1777 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1777 target RNA, herein schematically represented by GAM1 TARGET

RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1777 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1777 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39561] GAM1778 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1778 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1778 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1778 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39562] It is appreciated that specific functions, and accordingly utilities, of GR2937 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2937 gene: GAM1777 target protein and GAM1778 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1777 and GAM1778

[39563] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2938(GR2938) gene, which encodes an operon-like cluster of novel micro

RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39564] GR2938 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2938 gene was detected is described hereinabove with reference to Figs. 6-15.

[39565] GR2938 gene encodes GR2938 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39566] GR2938 precursor RNA folds spatially, forming GR2938 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2938 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2938 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39567] GR2938 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1782 precursor RNA and GAM1783 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM

precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39568] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1782 RNA and GAM1783 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39569] GAM1782 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1782 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1782 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1782 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39570] GAM1783 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1783 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1783 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1783 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39571] It is appreciated that specific functions, and accordingly utilities, of GR2938

gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2938 gene: GAM1782 target protein and GAM1783 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1782 and GAM1783

[39572] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2939 (GR2939) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39573] GR2939 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2939 gene was detected is described hereinabove with reference to Figs. 6-15.

[39574] GR2939 gene encodes GR2939 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39575] GR2939 precursor RNA folds spatially, forming GR2939 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2939 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as

hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2939 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39576] GR2939 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1784 precursor RNA and GAM1785 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39577] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1784 RNA and GAM1785 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39578] GAM1784 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1784 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1784 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1784 target protein, herein

schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39579] GAM1785 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1785 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1785 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1785 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39580] It is appreciated that specific functions, and accordingly utilities, of GR2939 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2939 gene: GAM1784 target protein and GAM1785 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1784 and GAM1785

[39581] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2940 (GR2940) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39582] GR2940 gene, herein designated GR GENE, is a novel bioinformatically

detected regulatory, non protein coding, RNA gene. The method by which GR2940 gene was detected is described hereinabove with reference to Figs. 6-15.

[39583] GR2940 gene encodes GR2940 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39584] GR2940 precursor RNA folds spatially, forming GR2940 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2940 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2940 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39585] GR2940 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1789 precursor RNA and GAM1790 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39586] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in

length, GAM1789 RNA and GAM1790 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39587] GAM1789 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1789 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1789 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1789 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39588] GAM1790 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1790 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1790 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1790 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39589] It is appreciated that specific functions, and accordingly utilities, of GR2940 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2940 gene: GAM1789 target protein and GAM1790 target protein, herein schematically represented by

GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1789 and GAM1790

[39590] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2941 (GR2941) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39591] GR2941 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2941 gene was detected is described hereinabove with reference to Figs. 6-15.

[39592] GR2941 gene encodes GR2941 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39593] GR2941 precursor RNA folds spatially, forming GR2941 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2941 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2941 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half

thereof, as is well known in the art.

- [39594] GR2941 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1796 precursor RNA and GAM1797 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [39595] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1796 RNA and GAM1797 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [39596] GAM1796 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1796 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1796 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1796 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.
- [39597] GAM1797 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1797 target RNA, herein schematically represented by GAM2 TARGET

RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1797 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1797 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39598] It is appreciated that specific functions, and accordingly utilities, of GR2941 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2941 gene: GAM1796 target protein and GAM1797 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1796 and GAM1797

[39599] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2942 (GR2942) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39600] GR2942 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2942 gene was detected is described hereinabove with reference to Figs. 6-15.

[39601] GR2942 gene encodes GR2942 precursor RNA, herein designated GR

PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39602] GR2942 precursor RNA folds spatially, forming GR2942 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2942 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2942 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39603] GR2942 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1800 precursor RNA and GAM1801 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39604] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1800 RNA and GAM1801 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39605] GAM1800 RNA, herein schematically represented by GAM1 binds

complimentarily to a target binding site located in an untranslated region of GAM1800 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1800 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1800 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39606] GAM1801 RNA, herein schematically represented by GAM2 binds complimentarily to a target binding site located in an untranslated region of GAM1801 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1801 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1801 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39607] It is appreciated that specific functions, and accordingly utilities, of GR2942 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2942 gene: GAM1800 target protein and GAM1801 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1800 and GAM1801

[39608] Fig. 16 further provides a conceptual description of novel bioinformatically

detected regulatory gene, referred to here as Genomic Record 2943(GR2943) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39609] GR2943 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2943 gene was detected is described hereinabove with reference to Figs. 6-15.

[39610] GR2943 gene encodes GR2943 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39611] GR2943 precursor RNA folds spatially, forming GR2943 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2943 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2943 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39612] GR2943 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1806 precursor RNA and

GAM1807 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39613] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1806 RNA and GAM1807 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39614] GAM1806 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1806 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1806 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1806 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39615] GAM1807 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1807 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1807 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1807 target protein, herein

schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39616] It is appreciated that specific functions, and accordingly utilities, of GR2943 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2943 gene: GAM1806 target protein and GAM1807 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1806 and GAM1807

[39617] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2944 (GR2944) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39618] GR2944 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2944 gene was detected is described hereinabove with reference to Figs. 6-15.

[39619] GR2944 gene encodes GR2944 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39620] GR2944 precursor RNA folds spatially, forming GR2944 folded precursor

RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2944 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2944 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39621] GR2944 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1812 precursor RNA and GAM1813 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39622] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1812 RNA and GAM1813 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39623] GAM1812 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1812 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1812 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1812 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39624] GAM1813 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1813 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1813 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1813 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39625] It is appreciated that specific functions, and accordingly utilities, of GR2944 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2944 gene: GAM1812 target protein and GAM1813 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1812 and GAM1813

[39626] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2945 (GR2945) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one

target gene, the function and utility of which at least one target gene is known in the art.

[39627] GR2945 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2945 gene was detected is described hereinabove with reference to Figs. 6-15.

[39628] GR2945 gene encodes GR2945 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39629] GR2945 precursor RNA folds spatially, forming GR2945 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2945 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2945 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39630] GR2945 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1830 precursor RNA and GAM1831 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to

## GAM PRECURSOR RNA of Fig. 8.

[39631] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1830 RNA and GAM1831 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39632] GAM1830 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1830 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1830 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1830 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39633] GAM1831 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1831 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1831 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1831 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39634] It is appreciated that specific functions, and accordingly utilities, of GR2945 gene, herein designated GR GENE, correlate with, and may be deduced

from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2945 gene: GAM1830 target protein and GAM1831 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1830 and GAM1831

[39635] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2946 (GR2946) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39636] GR2946 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2946 gene was detected is described hereinabove with reference to Figs. 6-15.

[39637] GR2946 gene encodes GR2946 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39638] GR2946 precursor RNA folds spatially, forming GR2946 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2946 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the

nucleotide sequence of GR2946 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

- [39639] GR2946 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1833 precursor RNA and GAM1834 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [39640] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1833 RNA and GAM1834 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [39641] GAM1833 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1833 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1833 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1833 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39642] GAM1834 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1834 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1834 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1834 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39643] It is appreciated that specific functions, and accordingly utilities, of GR2946 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2946 gene: GAM1833 target protein and GAM1834 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1833 and GAM1834

[39644] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2947 (GR2947) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39645] GR2947 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which

GR2947 gene was detected is described hereinabove with reference to Figs. 6-15.

[39646] GR2947 gene encodes GR2947 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39647] GR2947 precursor RNA folds spatially, forming GR2947 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2947 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2947 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39648] GR2947 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1842 precursor RNA and GAM1843 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39649] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1842 RNA and GAM1843 RNA respectively, herein

schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39650] GAM1842 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1842 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1842 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1842 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39651] GAM1843 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1843 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1843 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1843 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39652] It is appreciated that specific functions, and accordingly utilities, of GR2947 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2947 gene: GAM1842 target protein and GAM1843 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The

function of these target genes is elaborated hereinabove with reference to GAM1842 and GAM1843

- [39653] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2948 (GR2948) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [39654] GR2948 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2948 gene was detected is described hereinabove with reference to Figs. 6-15.
- [39655] GR2948 gene encodes GR2948 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [39656] GR2948 precursor RNA folds spatially, forming GR2948 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2948 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2948 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

- [39657] GR2948 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1850 precursor RNA and GAM1851 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [39658] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1850 RNA and GAM1851 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [39659] GAM1850 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1850 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1850 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1850 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.
- [39660] GAM1851 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1851 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1851 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1851 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39661] It is appreciated that specific functions, and accordingly utilities, of GR2948 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2948 gene: GAM1850 target protein and GAM1851 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1850 and GAM1851

[39662] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2949 (GR2949) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39663] GR2949 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2949 gene was detected is described hereinabove with reference to Figs. 6-15.

[39664] GR2949 gene encodes GR2949 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides

long.

[39665] GR2949 precursor RNA folds spatially, forming GR2949 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2949 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2949 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39666] GR2949 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1857 precursor RNA and GAM1858 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39667] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1857 RNA and GAM1858 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39668] GAM1857 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of

GAM1857 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1857 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1857 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39669] GAM1858 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1858 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1858 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1858 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39670] It is appreciated that specific functions, and accordingly utilities, of GR2949 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2949 gene: GAM1857 target protein and GAM1858 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1857 and GAM1858

[39671] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record

2950(GR2950) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39672] GR2950 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2950 gene was detected is described hereinabove with reference to Figs. 6-15.

[39673] GR2950 gene encodes GR2950 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39674] GR2950 precursor RNA folds spatially, forming GR2950 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2950 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2950 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39675] GR2950 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1860 precursor RNA and GAM1861 precursor RNA, herein schematically represented by GAM1

PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39676] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1860 RNA and GAM1861 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39677] GAM1860 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1860 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1860 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1860 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39678] GAM1861 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1861 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1861 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1861 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39679] It is appreciated that specific functions, and accordingly utilities, of GR2950 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2950 gene: GAM1860 target protein and GAM1861 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1860 and GAM1861

[39680] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2951 (GR2951) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39681] GR2951 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2951 gene was detected is described hereinabove with reference to Figs. 6-15.

[39682] GR2951 gene encodes GR2951 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39683] GR2951 precursor RNA folds spatially, forming GR2951 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2951 folded precursor RNA, herein designated GR FOLDED

PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2951 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39684] GR2951 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1866 precursor RNA and GAM1867 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39685] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1866 RNA and GAM1867 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39686] GAM1866 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1866 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1866 target RNA, herein schematically

represented by GAM1 TARGET RNA into GAM1866 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39687] GAM1867 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1867 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1867 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1867 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39688] It is appreciated that specific functions, and accordingly utilities, of GR2951 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2951 gene: GAM1866 target protein and GAM1867 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1866 and GAM1867

[39689] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2952 (GR2952) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

- [39690] GR2952 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2952 gene was detected is described hereinabove with reference to Figs. 6-15.
- [39691] GR2952 gene encodes GR2952 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [39692] GR2952 precursor RNA folds spatially, forming GR2952 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2952 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2952 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.
- [39693] GR2952 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1875 precursor RNA and GAM1876 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [39694] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX

of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1875 RNA and GAM1876 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39695] GAM1875 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1875 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1875 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1875 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39696] GAM1876 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1876 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1876 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1876 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39697] It is appreciated that specific functions, and accordingly utilities, of GR2952 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2952 gene: GAM1875 target

protein and GAM1876 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1875 and GAM1876

[39698] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2953 (GR2953) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39699] GR2953 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2953 gene was detected is described hereinabove with reference to Figs. 6-15.

[39700] GR2953 gene encodes GR2953 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39701] GR2953 precursor RNA folds spatially, forming GR2953 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2953 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2953 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence

which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39702] GR2953 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1880 precursor RNA and GAM1881 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39703] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1880 RNA and GAM1881 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39704] GAM1880 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1880 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1880 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1880 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39705] GAM1881 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of

GAM1881 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1881 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1881 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39706] It is appreciated that specific functions, and accordingly utilities, of GR2953 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2953 gene: GAM1880 target protein and GAM1881 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1880 and GAM1881

[39707] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2954 (GR2954) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39708] GR2954 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2954 gene was detected is described hereinabove with reference to Figs. 6-15.

[39709] GR2954 gene encodes GR2954 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39710] GR2954 precursor RNA folds spatially, forming GR2954 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2954 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2954 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39711] GR2954 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM1887 precursor RNA, GAM1888 precursor RNA and GAM1889 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR and GAM3 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39712] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1887 RNA, GAM1888 RNA and GAM1889 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA and GAM3

RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39713] GAM1887 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1887 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1887 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1887 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39714] GAM1888 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1888 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1888 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1888 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39715] GAM1889 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of GAM1889 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1889 target RNA, herein schematically

represented by GAM3 TARGET RNA into GAM1889 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[39716] It is appreciated that specific functions, and accordingly utilities, of GR2954 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2954 gene: GAM1887 target protein, GAM1888 target protein and GAM1889 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1887, GAM1888 and GAM1889

[39717] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2955(GR2955) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39718] GR2955 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2955 gene was detected is described hereinabove with reference to Figs. 6-15.

[39719] GR2955 gene encodes GR2955 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39720] GR2955 precursor RNA folds spatially, forming GR2955 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2955 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2955 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39721] GR2955 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1896 precursor RNA and GAM1897 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39722] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1896 RNA and GAM1897 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39723] GAM1896 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1896 target RNA, herein schematically represented by GAM1 TARGET

RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1896 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1896 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39724] GAM1897 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1897 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1897 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1897 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39725] It is appreciated that specific functions, and accordingly utilities, of GR2955 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2955 gene: GAM1896 target protein and GAM1897 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1896 and GAM1897

[39726] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2956(GR2956) gene, which encodes an operon-like cluster of novel micro

RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39727] GR2956 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2956 gene was detected is described hereinabove with reference to Figs. 6-15.

[39728] GR2956 gene encodes GR2956 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39729] GR2956 precursor RNA folds spatially, forming GR2956 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2956 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2956 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39730] GR2956 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1909 precursor RNA and GAM1910 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM

precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39731] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1909 RNA and GAM1910 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39732] GAM1909 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1909 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1909 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1909 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39733] GAM1910 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1910 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1910 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1910 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39734] It is appreciated that specific functions, and accordingly utilities, of GR2956

gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2956 gene: GAM1909 target protein and GAM1910 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1909 and GAM1910

[39735] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2957 (GR2957) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39736] GR2957 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2957 gene was detected is described hereinabove with reference to Figs. 6-15.

[39737] GR2957 gene encodes GR2957 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39738] GR2957 precursor RNA folds spatially, forming GR2957 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2957 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as

hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2957 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39739] GR2957 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM1912 precursor RNA, GAM1913 precursor RNA and GAM1914 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR and GAM3 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39740] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1912 RNA, GAM1913 RNA and GAM1914 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA and GAM3 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39741] GAM1912 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1912 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby

inhibiting translation of GAM1912 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1912 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39742] GAM1913 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1913 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1913 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1913 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39743] GAM1914 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of GAM1914 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1914 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM1914 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[39744] It is appreciated that specific functions, and accordingly utilities, of GR2957 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2957 gene: GAM1912 target protein, GAM1913 target protein and GAM1914 target protein, herein

schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1912, GAM1913 and GAM1914

- [39745] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2958(GR2958) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [39746] GR2958 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2958 gene was detected is described hereinabove with reference to Figs. 6-15.
- [39747] GR2958 gene encodes GR2958 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [39748] GR2958 precursor RNA folds spatially, forming GR2958 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2958 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2958 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence

which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39749] GR2958 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1915 precursor RNA and GAM1916 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39750] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1915 RNA and GAM1916 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39751] GAM1915 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1915 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1915 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1915 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39752] GAM1916 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of

GAM1916 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1916 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1916 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39753] It is appreciated that specific functions, and accordingly utilities, of GR2958 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2958 gene: GAM1915 target protein and GAM1916 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1915 and GAM1916

[39754] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2959 (GR2959) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39755] GR2959 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2959 gene was detected is described hereinabove with reference to Figs. 6-15.

[39756] GR2959 gene encodes GR2959 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39757] GR2959 precursor RNA folds spatially, forming GR2959 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2959 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2959 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39758] GR2959 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1922 precursor RNA and GAM1923 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39759] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1922 RNA and GAM1923 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39760] GAM1922 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1922 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1922 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1922 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39761] GAM1923 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1923 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1923 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1923 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39762] It is appreciated that specific functions, and accordingly utilities, of GR2959 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2959 gene: GAM1922 target protein and GAM1923 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1922 and GAM1923

- [39763] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2960 (GR2960) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [39764] GR2960 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2960 gene was detected is described hereinabove with reference to Figs. 6-15.
- [39765] GR2960 gene encodes GR2960 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [39766] GR2960 precursor RNA folds spatially, forming GR2960 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2960 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2960 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

- [39767] GR2960 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1940 precursor RNA and GAM1941 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [39768] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1940 RNA and GAM1941 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [39769] GAM1940 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1940 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1940 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1940 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.
- [39770] GAM1941 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1941 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1941 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1941 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39771] It is appreciated that specific functions, and accordingly utilities, of GR2960 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2960 gene: GAM1940 target protein and GAM1941 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1940 and GAM1941

[39772] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2961 (GR2961) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39773] GR2961 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2961 gene was detected is described hereinabove with reference to Figs. 6-15.

[39774] GR2961 gene encodes GR2961 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides

long.

[39775] GR2961 precursor RNA folds spatially, forming GR2961 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2961 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2961 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39776] GR2961 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1946 precursor RNA and GAM1947 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39777] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1946 RNA and GAM1947 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39778] GAM1946 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of

GAM1946 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1946 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1946 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39779] GAM1947 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1947 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1947 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1947 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39780] It is appreciated that specific functions, and accordingly utilities, of GR2961 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2961 gene: GAM1946 target protein and GAM1947 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1946 and GAM1947

[39781] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record

2962(GR2962) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39782] GR2962 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2962 gene was detected is described hereinabove with reference to Figs. 6-15.

[39783] GR2962 gene encodes GR2962 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39784] GR2962 precursor RNA folds spatially, forming GR2962 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2962 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2962 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39785] GR2962 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1949 precursor RNA and GAM1950 precursor RNA, herein schematically represented by GAM1

PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39786] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1949 RNA and GAM1950 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39787] GAM1949 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1949 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1949 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1949 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39788] GAM1950 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1950 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1950 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1950 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39789] It is appreciated that specific functions, and accordingly utilities, of GR2962 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2962 gene: GAM1949 target protein and GAM1950 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1949 and GAM1950

[39790] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2963 (GR2963) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39791] GR2963 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2963 gene was detected is described hereinabove with reference to Figs. 6-15.

[39792] GR2963 gene encodes GR2963 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39793] GR2963 precursor RNA folds spatially, forming GR2963 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2963 folded precursor RNA, herein designated GR FOLDED

PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2963 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39794] GR2963 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1952 precursor RNA and GAM1953 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39795] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1952 RNA and GAM1953 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39796] GAM1952 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1952 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1952 target RNA, herein schematically

represented by GAM1 TARGET RNA into GAM1952 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39797] GAM1953 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1953 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1953 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1953 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39798] It is appreciated that specific functions, and accordingly utilities, of GR2963 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2963 gene: GAM1952 target protein and GAM1953 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1952 and GAM1953

[39799] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2964 (GR2964) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39800] GR2964 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2964 gene was detected is described hereinabove with reference to Figs. 6-15.

[39801] GR2964 gene encodes GR2964 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39802] GR2964 precursor RNA folds spatially, forming GR2964 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2964 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2964 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39803] GR2964 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1954 precursor RNA and GAM1955 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39804] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX

of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1954 RNA and GAM1955 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39805] GAM1954 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1954 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1954 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1954 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39806] GAM1955 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1955 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1955 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1955 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39807] It is appreciated that specific functions, and accordingly utilities, of GR2964 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2964 gene: GAM1954 target

protein and GAM1955 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1954 and GAM1955

[39808] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2965 (GR2965) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39809] GR2965 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2965 gene was detected is described hereinabove with reference to Figs. 6-15.

[39810] GR2965 gene encodes GR2965 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39811] GR2965 precursor RNA folds spatially, forming GR2965 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2965 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2965 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence

which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

- [39812] GR2965 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1956 precursor RNA and GAM1957 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [39813] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1956 RNA and GAM1957 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [39814] GAM1956 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1956 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1956 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1956 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.
- [39815] GAM1957 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of

GAM1957 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1957 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1957 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39816] It is appreciated that specific functions, and accordingly utilities, of GR2965 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2965 gene: GAM1956 target protein and GAM1957 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1956 and GAM1957

[39817] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2966 (GR2966) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39818] GR2966 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2966 gene was detected is described hereinabove with reference to Figs. 6-15.

[39819] GR2966 gene encodes GR2966 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39820] GR2966 precursor RNA folds spatially, forming GR2966 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2966 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2966 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39821] GR2966 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1960 precursor RNA and GAM1961 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39822] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1960 RNA and GAM1961 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39823] GAM1960 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1960 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1960 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1960 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39824] GAM1961 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1961 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1961 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1961 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39825] It is appreciated that specific functions, and accordingly utilities, of GR2966 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2966 gene: GAM1960 target protein and GAM1961 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1960 and GAM1961

- [39826] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2967 (GR2967) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [39827] GR2967 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2967 gene was detected is described hereinabove with reference to Figs. 6-15.
- [39828] GR2967 gene encodes GR2967 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [39829] GR2967 precursor RNA folds spatially, forming GR2967 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2967 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2967 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.
- [39830] GR2967 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into

at least 3 separate GAM precursor RNAs, GAM1963 precursor RNA, GAM1964 precursor RNA and GAM1965 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR and GAM3 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39831] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1963 RNA, GAM1964 RNA and GAM1965 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA and GAM3 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39832] GAM1963 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1963 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1963 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1963 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39833] GAM1964 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1964 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1964 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1964 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39834] GAM1965 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of GAM1965 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1965 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM1965 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[39835] It is appreciated that specific functions, and accordingly utilities, of GR2967 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2967 gene: GAM1963 target protein, GAM1964 target protein and GAM1965 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1963, GAM1964 and GAM1965

[39836] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2968(GR2968) gene, which encodes an operon-like cluster of novel micro

RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39837] GR2968 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2968 gene was detected is described hereinabove with reference to Figs. 6-15.

[39838] GR2968 gene encodes GR2968 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39839] GR2968 precursor RNA folds spatially, forming GR2968 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2968 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2968 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39840] GR2968 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1969 precursor RNA and GAM1970 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM

precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39841] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1969 RNA and GAM1970 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39842] GAM1969 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1969 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1969 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1969 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39843] GAM1970 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1970 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1970 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1970 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39844] It is appreciated that specific functions, and accordingly utilities, of GR2968

gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2968 gene: GAM1969 target protein and GAM1970 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1969 and GAM1970

[39845] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2969 (GR2969) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39846] GR2969 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2969 gene was detected is described hereinabove with reference to Figs. 6-15.

[39847] GR2969 gene encodes GR2969 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39848] GR2969 precursor RNA folds spatially, forming GR2969 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2969 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as

hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2969 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39849] GR2969 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1981 precursor RNA and GAM1982 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39850] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1981 RNA and GAM1982 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39851] GAM1981 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1981 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1981 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1981 target protein, herein

schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39852] GAM1982 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1982 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1982 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1982 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39853] It is appreciated that specific functions, and accordingly utilities, of GR2969 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2969 gene: GAM1981 target protein and GAM1982 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1981 and GAM1982

[39854] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2970 (GR2970) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39855] GR2970 gene, herein designated GR GENE, is a novel bioinformatically

detected regulatory, non protein coding, RNA gene. The method by which GR2970 gene was detected is described hereinabove with reference to Figs. 6-15.

[39856] GR2970 gene encodes GR2970 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39857] GR2970 precursor RNA folds spatially, forming GR2970 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2970 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2970 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39858] GR2970 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1983 precursor RNA and GAM1984 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39859] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in

length, GAM1983 RNA and GAM1984 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39860] GAM1983 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1983 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1983 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1983 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39861] GAM1984 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1984 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1984 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1984 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39862] It is appreciated that specific functions, and accordingly utilities, of GR2970 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2970 gene: GAM1983 target protein and GAM1984 target protein, herein schematically represented by

GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1983 and GAM1984

[39863] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2971 (GR2971) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39864] GR2971 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2971 gene was detected is described hereinabove with reference to Figs. 6-15.

[39865] GR2971 gene encodes GR2971 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39866] GR2971 precursor RNA folds spatially, forming GR2971 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2971 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2971 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half

thereof, as is well known in the art.

- [39867] GR2971 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1986 precursor RNA and GAM1987 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [39868] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1986 RNA and GAM1987 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [39869] GAM1986 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1986 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1986 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1986 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.
- [39870] GAM1987 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1987 target RNA, herein schematically represented by GAM2 TARGET

RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1987 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1987 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39871] It is appreciated that specific functions, and accordingly utilities, of GR2971 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2971 gene: GAM1986 target protein and GAM1987 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1986 and GAM1987

[39872] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2972 (GR2972) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39873] GR2972 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2972 gene was detected is described hereinabove with reference to Figs. 6-15.

[39874] GR2972 gene encodes GR2972 precursor RNA, herein designated GR

PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39875] GR2972 precursor RNA folds spatially, forming GR2972 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2972 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2972 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39876] GR2972 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1995 precursor RNA and GAM1996 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39877] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1995 RNA and GAM1996 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39878] GAM1995 RNA, herein schematically represented by GAM1 binds

complimentarily to a target binding site located in an untranslated region of GAM1995 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1995 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1995 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39879] GAM1996 RNA, herein schematically represented by GAM2 binds complimentarily to a target binding site located in an untranslated region of GAM1996 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1996 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1996 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39880] It is appreciated that specific functions, and accordingly utilities, of GR2972 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2972 gene: GAM1995 target protein and GAM1996 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1995 and GAM1996

[39881] Fig. 16 further provides a conceptual description of novel bioinformatically

detected regulatory gene, referred to here as Genomic Record

2973(GR2973) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39882] GR2973 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2973 gene was detected is described hereinabove with reference to Figs. 6-15.

[39883] GR2973 gene encodes GR2973 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39884] GR2973 precursor RNA folds spatially, forming GR2973 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2973 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2973 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39885] GR2973 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2002 precursor RNA and

GAM2003 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39886] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2002 RNA and GAM2003 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39887] GAM2002 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2002 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2002 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2002 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39888] GAM2003 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2003 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2003 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2003 target protein, herein

schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39889] It is appreciated that specific functions, and accordingly utilities, of GR2973 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2973 gene: GAM2002 target protein and GAM2003 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2002 and GAM2003

[39890] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2974 (GR2974) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39891] GR2974 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2974 gene was detected is described hereinabove with reference to Figs. 6-15.

[39892] GR2974 gene encodes GR2974 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39893] GR2974 precursor RNA folds spatially, forming GR2974 folded precursor

RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2974 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2974 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39894] GR2974 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2010 precursor RNA and GAM2011 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39895] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2010 RNA and GAM2011 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39896] GAM2010 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2010 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2010 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2010 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39897] GAM2011 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2011 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2011 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2011 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39898] It is appreciated that specific functions, and accordingly utilities, of GR2974 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2974 gene: GAM2010 target protein and GAM2011 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2010 and GAM2011

[39899] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2975 (GR2975) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one

target gene, the function and utility of which at least one target gene is known in the art.

[39900] GR2975 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2975 gene was detected is described hereinabove with reference to Figs. 6-15.

[39901] GR2975 gene encodes GR2975 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39902] GR2975 precursor RNA folds spatially, forming GR2975 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2975 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2975 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39903] GR2975 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2022 precursor RNA and GAM2023 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to

## GAM PRECURSOR RNA of Fig. 8.

[39904] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2022 RNA and GAM2023 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39905] GAM2022 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2022 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2022 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2022 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39906] GAM2023 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2023 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2023 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2023 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39907] It is appreciated that specific functions, and accordingly utilities, of GR2975 gene, herein designated GR GENE, correlate with, and may be deduced

from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2975 gene: GAM2022 target protein and GAM2023 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2022 and GAM2023

[39908] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2976 (GR2976) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39909] GR2976 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2976 gene was detected is described hereinabove with reference to Figs. 6-15.

[39910] GR2976 gene encodes GR2976 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39911] GR2976 precursor RNA folds spatially, forming GR2976 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2976 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the

nucleotide sequence of GR2976 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

- [39912] GR2976 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2026 precursor RNA and GAM2027 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [39913] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2026 RNA and GAM2027 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [39914] GAM2026 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2026 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2026 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2026 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39915] GAM2027 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2027 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2027 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2027 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39916] It is appreciated that specific functions, and accordingly utilities, of GR2976 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2976 gene: GAM2026 target protein and GAM2027 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2026 and GAM2027

[39917] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2977 (GR2977) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39918] GR2977 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which

GR2977 gene was detected is described hereinabove with reference to Figs. 6-15.

[39919] GR2977 gene encodes GR2977 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39920] GR2977 precursor RNA folds spatially, forming GR2977 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2977 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2977 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39921] GR2977 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2032 precursor RNA and GAM2033 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39922] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2032 RNA and GAM2033 RNA respectively, herein

schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39923] GAM2032 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2032 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2032 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2032 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39924] GAM2033 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2033 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2033 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2033 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39925] It is appreciated that specific functions, and accordingly utilities, of GR2977 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2977 gene: GAM2032 target protein and GAM2033 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The

function of these target genes is elaborated hereinabove with reference to GAM2032 and GAM2033

- [39926] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2978 (GR2978) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [39927] GR2978 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2978 gene was detected is described hereinabove with reference to Figs. 6-15.
- [39928] GR2978 gene encodes GR2978 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [39929] GR2978 precursor RNA folds spatially, forming GR2978 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2978 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2978 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

- [39930] GR2978 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2039 precursor RNA and GAM2040 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [39931] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2039 RNA and GAM2040 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [39932] GAM2039 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2039 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2039 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2039 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.
- [39933] GAM2040 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2040 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2040 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2040 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39934] It is appreciated that specific functions, and accordingly utilities, of GR2978 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2978 gene: GAM2039 target protein and GAM2040 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2039 and GAM2040

[39935] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2979 (GR2979) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39936] GR2979 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2979 gene was detected is described hereinabove with reference to Figs. 6-15.

[39937] GR2979 gene encodes GR2979 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides

long.

[39938] GR2979 precursor RNA folds spatially, forming GR2979 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2979 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2979 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39939] GR2979 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2042 precursor RNA and GAM2043 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39940] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2042 RNA and GAM2043 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39941] GAM2042 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of

GAM2042 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2042 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2042 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39942] GAM2043 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2043 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2043 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2043 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39943] It is appreciated that specific functions, and accordingly utilities, of GR2979 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2979 gene: GAM2042 target protein and GAM2043 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2042 and GAM2043

[39944] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record

2980(GR2980) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39945] GR2980 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2980 gene was detected is described hereinabove with reference to Figs. 6-15.

[39946] GR2980 gene encodes GR2980 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39947] GR2980 precursor RNA folds spatially, forming GR2980 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2980 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2980 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39948] GR2980 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2047 precursor RNA and GAM2048 precursor RNA, herein schematically represented by GAM1

PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39949] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2047 RNA and GAM2048 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39950] GAM2047 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2047 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2047 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2047 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39951] GAM2048 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2048 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2048 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2048 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39952] It is appreciated that specific functions, and accordingly utilities, of GR2980 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2980 gene: GAM2047 target protein and GAM2048 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2047 and GAM2048

[39953] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2981 (GR2981) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39954] GR2981 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2981 gene was detected is described hereinabove with reference to Figs. 6-15.

[39955] GR2981 gene encodes GR2981 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39956] GR2981 precursor RNA folds spatially, forming GR2981 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2981 folded precursor RNA, herein designated GR FOLDED

PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2981 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39957] GR2981 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM2051 precursor RNA, GAM2052 precursor RNA and GAM2053 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR and GAM3 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39958] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2051 RNA, GAM2052 RNA and GAM2053 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA and GAM3 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39959] GAM2051 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2051 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2051 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2051 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39960] GAM2052 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2052 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2052 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2052 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39961] GAM2053 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of GAM2053 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2053 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM2053 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[39962] It is appreciated that specific functions, and accordingly utilities, of GR2981 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2981 gene: GAM2051 target

protein, GAM2052 target protein and GAM2053 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2051, GAM2052 and GAM2053

- [39963] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2982 (GR2982) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [39964] GR2982 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2982 gene was detected is described hereinabove with reference to Figs. 6-15.
- [39965] GR2982 gene encodes GR2982 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [39966] GR2982 precursor RNA folds spatially, forming GR2982 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2982 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2982 precursor RNA comprises a plurality of

segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39967] GR2982 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2054 precursor RNA and GAM2055 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39968] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2054 RNA and GAM2055 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39969] GAM2054 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2054 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2054 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2054 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39970] GAM2055 RNA, herein schematically represented by GAM2 binds

complimentarily to a target binding site located in an untranslated region of GAM2055 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2055 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2055 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39971] It is appreciated that specific functions, and accordingly utilities, of GR2982 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2982 gene: GAM2054 target protein and GAM2055 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2054 and GAM2055

[39972] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2983 (GR2983) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39973] GR2983 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2983 gene was detected is described hereinabove with reference to Figs.

- [39974] GR2983 gene encodes GR2983 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [39975] GR2983 precursor RNA folds spatially, forming GR2983 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2983 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2983 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.
- [39976] GR2983 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2088 precursor RNA and GAM2089 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [39977] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2088 RNA and GAM2089 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively,

each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39978] GAM2088 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2088 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2088 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2088 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39979] GAM2089 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2089 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2089 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2089 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39980] It is appreciated that specific functions, and accordingly utilities, of GR2983 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2983 gene: GAM2088 target protein and GAM2089 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to

- [39981] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2984 (GR2984) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [39982] GR2984 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2984 gene was detected is described hereinabove with reference to Figs. 6-15.
- [39983] GR2984 gene encodes GR2984 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [39984] GR2984 precursor RNA folds spatially, forming GR2984 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2984 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2984 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

- [39985] GR2984 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2093 precursor RNA and GAM2094 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [39986] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2093 RNA and GAM2094 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [39987] GAM2093 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2093 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2093 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2093 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.
- [39988] GAM2094 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2094 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2094 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2094 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39989] It is appreciated that specific functions, and accordingly utilities, of GR2984 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2984 gene: GAM2093 target protein and GAM2094 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2093 and GAM2094

[39990] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2985 (GR2985) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39991] GR2985 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2985 gene was detected is described hereinabove with reference to Figs. 6-15.

[39992] GR2985 gene encodes GR2985 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides

long.

[39993] GR2985 precursor RNA folds spatially, forming GR2985 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2985 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2985 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39994] GR2985 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM2095 precursor RNA, GAM2096 precursor RNA and GAM2097 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR and GAM3 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39995] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2095 RNA, GAM2096 RNA and GAM2097 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA and GAM3 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

- [39996] GAM2095 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2095 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2095 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2095 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.
- [39997] GAM2096 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2096 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2096 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2096 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.
- [39998] GAM2097 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of GAM2097 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2097 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM2097 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[39999] It is appreciated that specific functions, and accordingly utilities, of GR2985 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2985 gene: GAM2095 target protein, GAM2096 target protein and GAM2097 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2095, GAM2096 and GAM2097

[40000] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2986 (GR2986) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40001] GR2986 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2986 gene was detected is described hereinabove with reference to Figs. 6-15.

[40002] GR2986 gene encodes GR2986 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40003] GR2986 precursor RNA folds spatially, forming GR2986 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated

that GR2986 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2986 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40004] GR2986 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2105 precursor RNA and GAM2106 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40005] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2105 RNA and GAM2106 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40006] GAM2105 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2105 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby

inhibiting translation of GAM2105 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2105 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40007] GAM2106 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2106 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2106 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2106 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40008] It is appreciated that specific functions, and accordingly utilities, of GR2986 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2986 gene: GAM2105 target protein and GAM2106 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2105 and GAM2106

[40009] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2987 (GR2987) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is

known in the art.

[40010] GR2987 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2987 gene was detected is described hereinabove with reference to Figs. 6-15.

[40011] GR2987 gene encodes GR2987 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40012] GR2987 precursor RNA folds spatially, forming GR2987 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2987 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2987 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40013] GR2987 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2108 precursor RNA and GAM2109 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40014] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2108 RNA and GAM2109 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40015] GAM2108 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2108 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2108 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2108 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40016] GAM2109 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2109 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2109 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2109 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40017] It is appreciated that specific functions, and accordingly utilities, of GR2987 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs

comprised in the operon-like cluster of GR2987 gene: GAM2108 target protein and GAM2109 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2108 and GAM2109

[40018] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2988 (GR2988) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40019] GR2988 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2988 gene was detected is described hereinabove with reference to Figs. 6-15.

[40020] GR2988 gene encodes GR2988 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40021] GR2988 precursor RNA folds spatially, forming GR2988 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2988 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2988 precursor RNA comprises a plurality of

segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40022] GR2988 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2110 precursor RNA and GAM2111 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40023] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2110 RNA and GAM2111 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40024] GAM2110 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2110 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2110 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2110 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40025] GAM2111 RNA, herein schematically represented by GAM2 binds

complimentarily to a target binding site located in an untranslated region of GAM2111 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2111 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2111 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40026] It is appreciated that specific functions, and accordingly utilities, of GR2988 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2988 gene: GAM2110 target protein and GAM2111 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2110 and GAM2111

[40027] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2989 (GR2989) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40028] GR2989 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2989 gene was detected is described hereinabove with reference to Figs.

- [40029] GR2989 gene encodes GR2989 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [40030] GR2989 precursor RNA folds spatially, forming GR2989 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2989 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2989 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.
- [40031] GR2989 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2117 precursor RNA and GAM2118 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [40032] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2117 RNA and GAM2118 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively,

each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40033] GAM2117 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2117 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2117 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2117 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40034] GAM2118 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2118 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2118 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2118 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40035] It is appreciated that specific functions, and accordingly utilities, of GR2989 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2989 gene: GAM2117 target protein and GAM2118 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to

- [40036] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2990 (GR2990) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [40037] GR2990 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2990 gene was detected is described hereinabove with reference to Figs. 6-15.
- [40038] GR2990 gene encodes GR2990 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [40039] GR2990 precursor RNA folds spatially, forming GR2990 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2990 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2990 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

- [40040] GR2990 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2119 precursor RNA and GAM2120 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [40041] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2119 RNA and GAM2120 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [40042] GAM2119 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2119 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2119 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2119 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.
- [40043] GAM2120 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2120 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2120 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2120 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40044] It is appreciated that specific functions, and accordingly utilities, of GR2990 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2990 gene: GAM2119 target protein and GAM2120 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2119 and GAM2120

[40045] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2991 (GR2991) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40046] GR2991 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2991 gene was detected is described hereinabove with reference to Figs. 6-15.

[40047] GR2991 gene encodes GR2991 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides

long.

[40048] GR2991 precursor RNA folds spatially, forming GR2991 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2991 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2991 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40049] GR2991 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2126 precursor RNA and GAM2127 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40050] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2126 RNA and GAM2127 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40051] GAM2126 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of

GAM2126 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2126 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2126 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40052] GAM2127 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2127 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2127 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2127 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40053] It is appreciated that specific functions, and accordingly utilities, of GR2991 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2991 gene: GAM2126 target protein and GAM2127 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2126 and GAM2127

[40054] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record

2992(GR2992) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40055] GR2992 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2992 gene was detected is described hereinabove with reference to Figs. 6-15.

[40056] GR2992 gene encodes GR2992 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40057] GR2992 precursor RNA folds spatially, forming GR2992 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2992 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2992 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40058] GR2992 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2129 precursor RNA and GAM2130 precursor RNA, herein schematically represented by GAM1

PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40059] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2129 RNA and GAM2130 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40060] GAM2129 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2129 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2129 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2129 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40061] GAM2130 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2130 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2130 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2130 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40062] It is appreciated that specific functions, and accordingly utilities, of GR2992 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2992 gene: GAM2129 target protein and GAM2130 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2129 and GAM2130

[40063] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2993 (GR2993) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40064] GR2993 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2993 gene was detected is described hereinabove with reference to Figs. 6-15.

[40065] GR2993 gene encodes GR2993 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40066] GR2993 precursor RNA folds spatially, forming GR2993 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2993 folded precursor RNA, herein designated GR FOLDED

PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2993 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40067] GR2993 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2131 precursor RNA and GAM2132 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40068] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2131 RNA and GAM2132 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40069] GAM2131 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2131 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2131 target RNA, herein schematically

represented by GAM1 TARGET RNA into GAM2131 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40070] GAM2132 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2132 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2132 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2132 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40071] It is appreciated that specific functions, and accordingly utilities, of GR2993 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2993 gene: GAM2131 target protein and GAM2132 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2131 and GAM2132

[40072] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2994 (GR2994) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

- [40073] GR2994 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2994 gene was detected is described hereinabove with reference to Figs. 6-15.
- [40074] GR2994 gene encodes GR2994 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [40075] GR2994 precursor RNA folds spatially, forming GR2994 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2994 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2994 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.
- [40076] GR2994 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2138 precursor RNA and GAM2139 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [40077] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX

of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2138 RNA and GAM2139 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40078] GAM2138 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2138 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2138 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2138 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40079] GAM2139 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2139 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2139 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2139 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40080] It is appreciated that specific functions, and accordingly utilities, of GR2994 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2994 gene: GAM2138 target

protein and GAM2139 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2138 and GAM2139

[40081] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2995 (GR2995) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40082] GR2995 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2995 gene was detected is described hereinabove with reference to Figs. 6-15.

[40083] GR2995 gene encodes GR2995 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40084] GR2995 precursor RNA folds spatially, forming GR2995 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2995 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2995 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence

which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40085] GR2995 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM2140 precursor RNA, GAM2141 precursor RNA and GAM2142 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR and GAM3 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40086] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2140 RNA, GAM2141 RNA and GAM2142 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA and GAM3 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40087] GAM2140 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2140 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2140 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2140 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40088] GAM2141 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2141 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2141 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2141 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40089] GAM2142 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of GAM2142 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2142 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM2142 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[40090] It is appreciated that specific functions, and accordingly utilities, of GR2995 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2995 gene: GAM2140 target protein, GAM2141 target protein and GAM2142 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2140, GAM2141 and GAM2142

- [40091] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2996 (GR2996) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [40092] GR2996 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2996 gene was detected is described hereinabove with reference to Figs. 6-15.
- [40093] GR2996 gene encodes GR2996 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [40094] GR2996 precursor RNA folds spatially, forming GR2996 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2996 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2996 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.
- [40095] GR2996 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into

at least 2 separate GAM precursor RNAs, GAM2146 precursor RNA and GAM2147 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40096] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2146 RNA and GAM2147 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40097] GAM2146 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2146 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2146 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2146 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40098] GAM2147 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2147 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2147 target RNA, herein schematically

represented by GAM2 TARGET RNA into GAM2147 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40099] It is appreciated that specific functions, and accordingly utilities, of GR2996 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2996 gene: GAM2146 target protein and GAM2147 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2146 and GAM2147

[40100] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2997 (GR2997) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40101] GR2997 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2997 gene was detected is described hereinabove with reference to Figs. 6-15.

[40102] GR2997 gene encodes GR2997 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40103] GR2997 precursor RNA folds spatially, forming GR2997 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2997 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2997 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40104] GR2997 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2148 precursor RNA and GAM2149 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40105] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2148 RNA and GAM2149 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40106] GAM2148 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2148 target RNA, herein schematically represented by GAM1 TARGET

RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2148 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2148 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40107] GAM2149 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2149 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2149 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2149 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40108] It is appreciated that specific functions, and accordingly utilities, of GR2997 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2997 gene: GAM2148 target protein and GAM2149 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2148 and GAM2149

[40109] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2998(GR2998) gene, which encodes an operon-like cluster of novel micro

RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40110] GR2998 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2998 gene was detected is described hereinabove with reference to Figs. 6-15.

[40111] GR2998 gene encodes GR2998 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40112] GR2998 precursor RNA folds spatially, forming GR2998 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2998 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2998 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40113] GR2998 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2155 precursor RNA and GAM2156 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM

precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40114] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2155 RNA and GAM2156 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40115] GAM2155 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2155 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2155 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2155 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40116] GAM2156 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2156 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2156 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2156 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40117] It is appreciated that specific functions, and accordingly utilities, of GR2998

gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2998 gene: GAM2155 target protein and GAM2156 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2155 and GAM2156

[40118] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2999 (GR2999) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40119] GR2999 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2999 gene was detected is described hereinabove with reference to Figs. 6-15.

[40120] GR2999 gene encodes GR2999 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40121] GR2999 precursor RNA folds spatially, forming GR2999 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2999 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as

hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2999 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40122] GR2999 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2158 precursor RNA and GAM2159 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40123] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2158 RNA and GAM2159 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40124] GAM2158 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2158 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2158 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2158 target protein, herein

schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40125] GAM2159 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2159 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2159 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2159 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40126] It is appreciated that specific functions, and accordingly utilities, of GR2999 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2999 gene: GAM2158 target protein and GAM2159 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2158 and GAM2159

[40127] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3000 (GR3000) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40128] GR3000 gene, herein designated GR GENE, is a novel bioinformatically

detected regulatory, non protein coding, RNA gene. The method by which GR3000 gene was detected is described hereinabove with reference to Figs. 6-15.

[40129] GR3000 gene encodes GR3000 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40130] GR3000 precursor RNA folds spatially, forming GR3000 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3000 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3000 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40131] GR3000 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2169 precursor RNA and GAM2170 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40132] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in

length, GAM2169 RNA and GAM2170 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40133] GAM2169 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2169 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2169 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2169 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40134] GAM2170 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2170 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2170 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2170 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40135] It is appreciated that specific functions, and accordingly utilities, of GR3000 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3000 gene: GAM2169 target protein and GAM2170 target protein, herein schematically represented by

GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2169 and GAM2170

- [40136] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3001 (GR3001) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [40137] GR3001 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3001 gene was detected is described hereinabove with reference to Figs. 6-15.
- [40138] GR3001 gene encodes GR3001 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [40139] GR3001 precursor RNA folds spatially, forming GR3001 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3001 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3001 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half

thereof, as is well known in the art.

- [40140] GR3001 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2186 precursor RNA and GAM2187 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [40141] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2186 RNA and GAM2187 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [40142] GAM2186 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2186 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2186 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2186 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.
- [40143] GAM2187 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2187 target RNA, herein schematically represented by GAM2 TARGET

RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2187 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2187 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40144] It is appreciated that specific functions, and accordingly utilities, of GR3001 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3001 gene: GAM2186 target protein and GAM2187 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2186 and GAM2187

[40145] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3002 (GR3002) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40146] GR3002 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3002 gene was detected is described hereinabove with reference to Figs. 6-15.

[40147] GR3002 gene encodes GR3002 precursor RNA, herein designated GR

PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40148] GR3002 precursor RNA folds spatially, forming GR3002 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3002 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3002 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40149] GR3002 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2193 precursor RNA and GAM2194 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40150] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2193 RNA and GAM2194 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40151] GAM2193 RNA, herein schematically represented by GAM1 binds

complimentarily to a target binding site located in an untranslated region of GAM2193 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2193 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2193 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40152] GAM2194 RNA, herein schematically represented by GAM2 binds complimentarily to a target binding site located in an untranslated region of GAM2194 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2194 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2194 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40153] It is appreciated that specific functions, and accordingly utilities, of GR3002 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3002 gene: GAM2193 target protein and GAM2194 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2193 and GAM2194

[40154] Fig. 16 further provides a conceptual description of novel bioinformatically

detected regulatory gene, referred to here as Genomic Record

3003(GR3003) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40155] GR3003 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3003 gene was detected is described hereinabove with reference to Figs. 6-15.

[40156] GR3003 gene encodes GR3003 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40157] GR3003 precursor RNA folds spatially, forming GR3003 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3003 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3003 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40158] GR3003 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2195 precursor RNA and

GAM2196 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40159] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2195 RNA and GAM2196 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40160] GAM2195 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2195 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2195 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2195 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40161] GAM2196 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2196 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2196 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2196 target protein, herein

schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40162] It is appreciated that specific functions, and accordingly utilities, of GR3003 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3003 gene: GAM2195 target protein and GAM2196 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2195 and GAM2196

[40163] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3004 (GR3004) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40164] GR3004 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3004 gene was detected is described hereinabove with reference to Figs. 6-15.

[40165] GR3004 gene encodes GR3004 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40166] GR3004 precursor RNA folds spatially, forming GR3004 folded precursor

RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3004 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3004 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40167] GR3004 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2203 precursor RNA and GAM2204 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40168] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2203 RNA and GAM2204 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40169] GAM2203 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2203 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2203 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2203 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40170] GAM2204 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2204 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2204 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2204 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40171] It is appreciated that specific functions, and accordingly utilities, of GR3004 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3004 gene: GAM2203 target protein and GAM2204 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2203 and GAM2204

[40172] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3005 (GR3005) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one

target gene, the function and utility of which at least one target gene is known in the art.

[40173] GR3005 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3005 gene was detected is described hereinabove with reference to Figs. 6-15.

[40174] GR3005 gene encodes GR3005 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40175] GR3005 precursor RNA folds spatially, forming GR3005 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3005 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3005 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40176] GR3005 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2213 precursor RNA and GAM2214 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to

## GAM PRECURSOR RNA of Fig. 8.

[40177] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2213 RNA and GAM2214 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40178] GAM2213 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2213 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2213 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2213 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40179] GAM2214 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2214 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2214 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2214 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40180] It is appreciated that specific functions, and accordingly utilities, of GR3005 gene, herein designated GR GENE, correlate with, and may be deduced

from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3005 gene: GAM2213 target protein and GAM2214 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2213 and GAM2214

[40181] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3006 (GR3006) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40182] GR3006 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3006 gene was detected is described hereinabove with reference to Figs. 6-15.

[40183] GR3006 gene encodes GR3006 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40184] GR3006 precursor RNA folds spatially, forming GR3006 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3006 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the

nucleotide sequence of GR3006 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40185] GR3006 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2228 precursor RNA and GAM2229 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40186] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2228 RNA and GAM2229 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40187] GAM2228 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2228 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2228 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2228 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40188] GAM2229 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2229 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2229 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2229 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40189] It is appreciated that specific functions, and accordingly utilities, of GR3006 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3006 gene: GAM2228 target protein and GAM2229 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2228 and GAM2229

[40190] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3007 (GR3007) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40191] GR3007 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which

GR3007 gene was detected is described hereinabove with reference to Figs. 6-15.

[40192] GR3007 gene encodes GR3007 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40193] GR3007 precursor RNA folds spatially, forming GR3007 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3007 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3007 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40194] GR3007 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2238 precursor RNA and GAM2239 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40195] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2238 RNA and GAM2239 RNA respectively, herein

schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40196] GAM2238 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2238 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2238 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2238 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40197] GAM2239 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2239 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2239 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2239 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40198] It is appreciated that specific functions, and accordingly utilities, of GR3007 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3007 gene: GAM2238 target protein and GAM2239 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The

function of these target genes is elaborated hereinabove with reference to GAM2238 and GAM2239

- [40199] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3008(GR3008) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [40200] GR3008 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3008 gene was detected is described hereinabove with reference to Figs. 6-15.
- [40201] GR3008 gene encodes GR3008 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [40202] GR3008 precursor RNA folds spatially, forming GR3008 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3008 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3008 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40203] GR3008 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM2253 precursor RNA, GAM2254 precursor RNA and GAM2255 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR and GAM3 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40204] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2253 RNA, GAM2254 RNA and GAM2255 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA and GAM3 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40205] GAM2253 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2253 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2253 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2253 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40206] GAM2254 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of

GAM2254 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2254 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2254 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40207] GAM2255 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of GAM2255 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2255 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM2255 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[40208] It is appreciated that specific functions, and accordingly utilities, of GR3008 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3008 gene: GAM2253 target protein, GAM2254 target protein and GAM2255 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2253, GAM2254 and GAM2255

[40209] Fig. 16 further provides a conceptual description of novel bioinformatically

detected regulatory gene, referred to here as Genomic Record 3009(GR3009) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40210] GR3009 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3009 gene was detected is described hereinabove with reference to Figs. 6-15.

[40211] GR3009 gene encodes GR3009 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40212] GR3009 precursor RNA folds spatially, forming GR3009 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3009 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3009 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40213] GR3009 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2259 precursor RNA and

GAM2260 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40214] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2259 RNA and GAM2260 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40215] GAM2259 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2259 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2259 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2259 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40216] GAM2260 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2260 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2260 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2260 target protein, herein

schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40217] It is appreciated that specific functions, and accordingly utilities, of GR3009 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3009 gene: GAM2259 target protein and GAM2260 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2259 and GAM2260

[40218] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3010 (GR3010) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40219] GR3010 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3010 gene was detected is described hereinabove with reference to Figs. 6-15.

[40220] GR3010 gene encodes GR3010 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40221] GR3010 precursor RNA folds spatially, forming GR3010 folded precursor

RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3010 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3010 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40222] GR3010 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM2263 precursor RNA, GAM2264 precursor RNA and GAM2265 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR and GAM3 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40223] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2263 RNA, GAM2264 RNA and GAM2265 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA and GAM3 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40224] GAM2263 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of

GAM2263 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2263 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2263 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40225] GAM2264 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2264 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2264 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2264 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40226] GAM2265 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of GAM2265 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2265 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM2265 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[40227] It is appreciated that specific functions, and accordingly utilities, of GR3010 gene, herein designated GR GENE, correlate with, and may be deduced

from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3010 gene: GAM2263 target protein, GAM2264 target protein and GAM2265 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2263, GAM2264 and GAM2265

[40228] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3011(GR3011) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40229] GR3011 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3011 gene was detected is described hereinabove with reference to Figs. 6-15.

[40230] GR3011 gene encodes GR3011 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40231] GR3011 precursor RNA folds spatially, forming GR3011 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3011 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as

hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3011 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40232] GR3011 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2267 precursor RNA and GAM2268 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40233] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2267 RNA and GAM2268 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40234] GAM2267 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2267 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2267 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2267 target protein, herein

schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40235] GAM2268 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2268 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2268 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2268 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40236] It is appreciated that specific functions, and accordingly utilities, of GR3011 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3011 gene: GAM2267 target protein and GAM2268 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2267 and GAM2268

[40237] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3012 (GR3012) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40238] GR3012 gene, herein designated GR GENE, is a novel bioinformatically

detected regulatory, non protein coding, RNA gene. The method by which GR3012 gene was detected is described hereinabove with reference to Figs. 6-15.

[40239] GR3012 gene encodes GR3012 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40240] GR3012 precursor RNA folds spatially, forming GR3012 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3012 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3012 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40241] GR3012 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2271 precursor RNA and GAM2272 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40242] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in

length, GAM2271 RNA and GAM2272 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40243] GAM2271 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2271 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2271 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2271 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40244] GAM2272 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2272 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2272 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2272 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40245] It is appreciated that specific functions, and accordingly utilities, of GR3012 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3012 gene: GAM2271 target protein and GAM2272 target protein, herein schematically represented by

GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2271 and GAM2272

[40246] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3013 (GR3013) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40247] GR3013 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3013 gene was detected is described hereinabove with reference to Figs. 6-15.

[40248] GR3013 gene encodes GR3013 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40249] GR3013 precursor RNA folds spatially, forming GR3013 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3013 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3013 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half

thereof, as is well known in the art.

- [40250] GR3013 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2276 precursor RNA and GAM2277 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [40251] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2276 RNA and GAM2277 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [40252] GAM2276 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2276 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2276 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2276 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.
- [40253] GAM2277 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2277 target RNA, herein schematically represented by GAM2 TARGET

RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2277 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2277 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40254] It is appreciated that specific functions, and accordingly utilities, of GR3013 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3013 gene: GAM2276 target protein and GAM2277 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2276 and GAM2277

[40255] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3014 (GR3014) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40256] GR3014 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3014 gene was detected is described hereinabove with reference to Figs. 6-15.

[40257] GR3014 gene encodes GR3014 precursor RNA, herein designated GR

PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40258] GR3014 precursor RNA folds spatially, forming GR3014 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3014 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3014 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40259] GR3014 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2278 precursor RNA and GAM2279 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40260] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2278 RNA and GAM2279 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40261] GAM2278 RNA, herein schematically represented by GAM1 binds

complimentarily to a target binding site located in an untranslated region of GAM2278 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2278 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2278 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40262] GAM2279 RNA, herein schematically represented by GAM2 binds complimentarily to a target binding site located in an untranslated region of GAM2279 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2279 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2279 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40263] It is appreciated that specific functions, and accordingly utilities, of GR3014 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3014 gene: GAM2278 target protein and GAM2279 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2278 and GAM2279

[40264] Fig. 16 further provides a conceptual description of novel bioinformatically

detected regulatory gene, referred to here as Genomic Record

3015(GR3015) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40265] GR3015 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3015 gene was detected is described hereinabove with reference to Figs. 6-15.

[40266] GR3015 gene encodes GR3015 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40267] GR3015 precursor RNA folds spatially, forming GR3015 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3015 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3015 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40268] GR3015 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM2301 precursor RNA,

GAM2302 precursor RNA and GAM2303 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR and GAM3 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40269] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2301 RNA, GAM2302 RNA and GAM2303 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA and GAM3 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40270] GAM2301 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2301 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2301 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2301 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40271] GAM2302 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2302 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby

inhibiting translation of GAM2302 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2302 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40272] GAM2303 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of GAM2303 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2303 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM2303 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[40273] It is appreciated that specific functions, and accordingly utilities, of GR3015 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3015 gene: GAM2301 target protein, GAM2302 target protein and GAM2303 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2301, GAM2302 and GAM2303

[40274] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3016(GR3016) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one

target gene, the function and utility of which at least one target gene is known in the art.

[40275] GR3016 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3016 gene was detected is described hereinabove with reference to Figs. 6-15.

[40276] GR3016 gene encodes GR3016 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40277] GR3016 precursor RNA folds spatially, forming GR3016 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3016 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3016 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40278] GR3016 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2310 precursor RNA and GAM2311 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to

## GAM PRECURSOR RNA of Fig. 8.

[40279] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2310 RNA and GAM2311 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40280] GAM2310 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2310 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2310 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2310 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40281] GAM2311 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2311 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2311 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2311 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40282] It is appreciated that specific functions, and accordingly utilities, of GR3016 gene, herein designated GR GENE, correlate with, and may be deduced

from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3016 gene: GAM2310 target protein and GAM2311 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2310 and GAM2311

[40283] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3017(GR3017) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40284] GR3017 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3017 gene was detected is described hereinabove with reference to Figs. 6-15.

[40285] GR3017 gene encodes GR3017 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40286] GR3017 precursor RNA folds spatially, forming GR3017 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3017 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the

nucleotide sequence of GR3017 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40287] GR3017 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 4 separate GAM precursor RNAs, GAM2314 precursor RNA, GAM2315 precursor RNA, GAM2316 precursor RNA and GAM2317 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR, GAM3 PRECURSOR and GAM4 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40288] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2314 RNA, GAM2315 RNA, GAM2316 RNA and GAM2317 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA, GAM3 RNA and GAM4 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40289] GAM2314 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2314 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2314 target RNA, herein schematically

represented by GAM1 TARGET RNA into GAM2314 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40290] GAM2315 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2315 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2315 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2315 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40291] GAM2316 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of GAM2316 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2316 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM2316 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[40292] GAM2317 RNA, herein schematically represented by GAM4 binds complementarily to a target binding site located in an untranslated region of GAM2317 target RNA, herein schematically represented by GAM4 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2317 target RNA, herein schematically

represented by GAM4 TARGET RNA into GAM2317 target protein, herein schematically represented by GAM4 TARGET PROTEIN, both of Fig. 8.

[40293] It is appreciated that specific functions, and accordingly utilities, of GR3017 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3017 gene: GAM2314 target protein, GAM2315 target protein, GAM2316 target protein and GAM2317 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2314, GAM2315, GAM2316 and GAM2317

[40294] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3018(GR3018) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40295] GR3018 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3018 gene was detected is described hereinabove with reference to Figs. 6-15.

[40296] GR3018 gene encodes GR3018 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40297] GR3018 precursor RNA folds spatially, forming GR3018 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3018 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3018 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40298] GR3018 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2318 precursor RNA and GAM2319 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40299] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2318 RNA and GAM2319 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40300] GAM2318 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2318 target RNA, herein schematically represented by GAM1 TARGET

RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2318 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2318 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40301] GAM2319 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2319 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2319 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2319 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40302] It is appreciated that specific functions, and accordingly utilities, of GR3018 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3018 gene: GAM2318 target protein and GAM2319 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2318 and GAM2319

[40303] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3019 (GR3019) gene, which encodes an operon-like cluster of novel micro

RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40304] GR3019 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3019 gene was detected is described hereinabove with reference to Figs. 6-15.

[40305] GR3019 gene encodes GR3019 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40306] GR3019 precursor RNA folds spatially, forming GR3019 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3019 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3019 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40307] GR3019 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2327 precursor RNA and GAM2328 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM

precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40308] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2327 RNA and GAM2328 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40309] GAM2327 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2327 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2327 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2327 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40310] GAM2328 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2328 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2328 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2328 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40311] It is appreciated that specific functions, and accordingly utilities, of GR3019

gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3019 gene: GAM2327 target protein and GAM2328 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2327 and GAM2328

[40312] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3020(GR3020) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40313] GR3020 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3020 gene was detected is described hereinabove with reference to Figs. 6-15.

[40314] GR3020 gene encodes GR3020 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40315] GR3020 precursor RNA folds spatially, forming GR3020 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3020 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as

hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3020 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40316] GR3020 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2335 precursor RNA and GAM2336 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40317] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2335 RNA and GAM2336 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40318] GAM2335 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2335 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2335 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2335 target protein, herein

schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40319] GAM2336 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2336 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2336 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2336 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40320] It is appreciated that specific functions, and accordingly utilities, of GR3020 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3020 gene: GAM2335 target protein and GAM2336 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2335 and GAM2336

[40321] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3021 (GR3021) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40322] GR3021 gene, herein designated GR GENE, is a novel bioinformatically

detected regulatory, non protein coding, RNA gene. The method by which GR3021 gene was detected is described hereinabove with reference to Figs. 6-15.

[40323] GR3021 gene encodes GR3021 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40324] GR3021 precursor RNA folds spatially, forming GR3021 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3021 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3021 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40325] GR3021 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2351 precursor RNA and GAM2352 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40326] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in

length, GAM2351 RNA and GAM2352 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40327] GAM2351 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2351 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2351 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2351 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40328] GAM2352 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2352 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2352 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2352 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40329] It is appreciated that specific functions, and accordingly utilities, of GR3021 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3021 gene: GAM2351 target protein and GAM2352 target protein, herein schematically represented by

GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2351 and GAM2352

[40330] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3022(GR3022) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40331] GR3022 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3022 gene was detected is described hereinabove with reference to Figs. 6-15.

[40332] GR3022 gene encodes GR3022 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40333] GR3022 precursor RNA folds spatially, forming GR3022 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3022 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3022 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half

thereof, as is well known in the art.

- [40334] GR3022 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2362 precursor RNA and GAM2363 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [40335] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2362 RNA and GAM2363 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [40336] GAM2362 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2362 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2362 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2362 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.
- [40337] GAM2363 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2363 target RNA, herein schematically represented by GAM2 TARGET

RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2363 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2363 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40338] It is appreciated that specific functions, and accordingly utilities, of GR3022 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3022 gene: GAM2362 target protein and GAM2363 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2362 and GAM2363

[40339] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3023 (GR3023) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40340] GR3023 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3023 gene was detected is described hereinabove with reference to Figs. 6-15.

[40341] GR3023 gene encodes GR3023 precursor RNA, herein designated GR

PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40342] GR3023 precursor RNA folds spatially, forming GR3023 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3023 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3023 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40343] GR3023 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2371 precursor RNA and GAM2372 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40344] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2371 RNA and GAM2372 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40345] GAM2371 RNA, herein schematically represented by GAM1 binds

complimentarily to a target binding site located in an untranslated region of GAM2371 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2371 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2371 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40346] GAM2372 RNA, herein schematically represented by GAM2 binds complimentarily to a target binding site located in an untranslated region of GAM2372 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2372 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2372 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40347] It is appreciated that specific functions, and accordingly utilities, of GR3023 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3023 gene: GAM2371 target protein and GAM2372 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2371 and GAM2372

[40348] Fig. 16 further provides a conceptual description of novel bioinformatically

detected regulatory gene, referred to here as Genomic Record 3024(GR3024) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40349] GR3024 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3024 gene was detected is described hereinabove with reference to Figs. 6-15.

[40350] GR3024 gene encodes GR3024 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40351] GR3024 precursor RNA folds spatially, forming GR3024 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3024 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3024 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40352] GR3024 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2385 precursor RNA and

GAM2386 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40353] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2385 RNA and GAM2386 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40354] GAM2385 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2385 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2385 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2385 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40355] GAM2386 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2386 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2386 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2386 target protein, herein

schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40356] It is appreciated that specific functions, and accordingly utilities, of GR3024 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3024 gene: GAM2385 target protein and GAM2386 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2385 and GAM2386

[40357] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3025 (GR3025) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40358] GR3025 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3025 gene was detected is described hereinabove with reference to Figs. 6-15.

[40359] GR3025 gene encodes GR3025 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40360] GR3025 precursor RNA folds spatially, forming GR3025 folded precursor

RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3025 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3025 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40361] GR3025 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2393 precursor RNA and GAM2394 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40362] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2393 RNA and GAM2394 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40363] GAM2393 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2393 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2393 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2393 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40364] GAM2394 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2394 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2394 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2394 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40365] It is appreciated that specific functions, and accordingly utilities, of GR3025 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3025 gene: GAM2393 target protein and GAM2394 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2393 and GAM2394

[40366] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3026 (GR3026) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one

target gene, the function and utility of which at least one target gene is known in the art.

[40367] GR3026 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3026 gene was detected is described hereinabove with reference to Figs. 6-15.

[40368] GR3026 gene encodes GR3026 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40369] GR3026 precursor RNA folds spatially, forming GR3026 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3026 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3026 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40370] GR3026 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2413 precursor RNA and GAM2414 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to

## GAM PRECURSOR RNA of Fig. 8.

[40371] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2413 RNA and GAM2414 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40372] GAM2413 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2413 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2413 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2413 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40373] GAM2414 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2414 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2414 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2414 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40374] It is appreciated that specific functions, and accordingly utilities, of GR3026 gene, herein designated GR GENE, correlate with, and may be deduced

from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3026 gene: GAM2413 target protein and GAM2414 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2413 and GAM2414

[40375] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3027(GR3027) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40376] GR3027 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3027 gene was detected is described hereinabove with reference to Figs. 6-15.

[40377] GR3027 gene encodes GR3027 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40378] GR3027 precursor RNA folds spatially, forming GR3027 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3027 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the

nucleotide sequence of GR3027 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40379] GR3027 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2415 precursor RNA and GAM2416 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40380] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2415 RNA and GAM2416 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40381] GAM2415 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2415 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2415 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2415 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40382] GAM2416 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2416 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2416 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2416 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40383] It is appreciated that specific functions, and accordingly utilities, of GR3027 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3027 gene: GAM2415 target protein and GAM2416 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2415 and GAM2416

[40384] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3028 (GR3028) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40385] GR3028 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which

GR3028 gene was detected is described hereinabove with reference to Figs. 6-15.

[40386] GR3028 gene encodes GR3028 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40387] GR3028 precursor RNA folds spatially, forming GR3028 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3028 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3028 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40388] GR3028 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2422 precursor RNA and GAM2423 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40389] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2422 RNA and GAM2423 RNA respectively, herein

schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40390] GAM2422 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2422 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2422 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2422 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40391] GAM2423 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2423 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2423 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2423 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40392] It is appreciated that specific functions, and accordingly utilities, of GR3028 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3028 gene: GAM2422 target protein and GAM2423 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The

function of these target genes is elaborated hereinabove with reference to GAM2422 and GAM2423

[40393] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3029(GR3029) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40394] GR3029 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3029 gene was detected is described hereinabove with reference to Figs. 6-15.

[40395] GR3029 gene encodes GR3029 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40396] GR3029 precursor RNA folds spatially, forming GR3029 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3029 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3029 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

- [40397] GR3029 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2424 precursor RNA and GAM2425 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [40398] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2424 RNA and GAM2425 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [40399] GAM2424 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2424 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2424 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2424 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.
- [40400] GAM2425 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2425 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2425 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2425 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40401] It is appreciated that specific functions, and accordingly utilities, of GR3029 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3029 gene: GAM2424 target protein and GAM2425 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2424 and GAM2425

[40402] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3030 (GR3030) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40403] GR3030 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3030 gene was detected is described hereinabove with reference to Figs. 6-15.

[40404] GR3030 gene encodes GR3030 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides

long.

[40405] GR3030 precursor RNA folds spatially, forming GR3030 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3030 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3030 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40406] GR3030 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2426 precursor RNA and GAM2427 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40407] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2426 RNA and GAM2427 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40408] GAM2426 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of

GAM2426 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2426 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2426 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40409] GAM2427 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2427 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2427 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2427 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40410] It is appreciated that specific functions, and accordingly utilities, of GR3030 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3030 gene: GAM2426 target protein and GAM2427 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2426 and GAM2427

[40411] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record

3031(GR3031) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40412] GR3031 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3031 gene was detected is described hereinabove with reference to Figs. 6-15.

[40413] GR3031 gene encodes GR3031 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40414] GR3031 precursor RNA folds spatially, forming GR3031 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3031 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3031 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40415] GR3031 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2445 precursor RNA and GAM2446 precursor RNA, herein schematically represented by GAM1

PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40416] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2445 RNA and GAM2446 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40417] GAM2445 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2445 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2445 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2445 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40418] GAM2446 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2446 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2446 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2446 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40419] It is appreciated that specific functions, and accordingly utilities, of GR3031 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3031 gene: GAM2445 target protein and GAM2446 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2445 and GAM2446

[40420] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3032 (GR3032) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40421] GR3032 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3032 gene was detected is described hereinabove with reference to Figs. 6-15.

[40422] GR3032 gene encodes GR3032 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40423] GR3032 precursor RNA folds spatially, forming GR3032 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3032 folded precursor RNA, herein designated GR FOLDED

PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3032 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40424] GR3032 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2452 precursor RNA and GAM2453 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40425] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2452 RNA and GAM2453 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40426] GAM2452 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2452 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2452 target RNA, herein schematically

represented by GAM1 TARGET RNA into GAM2452 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40427] GAM2453 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2453 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2453 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2453 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40428] It is appreciated that specific functions, and accordingly utilities, of GR3032 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3032 gene: GAM2452 target protein and GAM2453 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2452 and GAM2453

[40429] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3033 (GR3033) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40430] GR3033 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3033 gene was detected is described hereinabove with reference to Figs. 6-15.

[40431] GR3033 gene encodes GR3033 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40432] GR3033 precursor RNA folds spatially, forming GR3033 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3033 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3033 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40433] GR3033 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2455 precursor RNA and GAM2456 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40434] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX

of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2455 RNA and GAM2456 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40435] GAM2455 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2455 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2455 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2455 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40436] GAM2456 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2456 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2456 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2456 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40437] It is appreciated that specific functions, and accordingly utilities, of GR3033 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3033 gene: GAM2455 target

protein and GAM2456 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2455 and GAM2456

[40438] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3034(GR3034) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40439] GR3034 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3034 gene was detected is described hereinabove with reference to Figs. 6-15.

[40440] GR3034 gene encodes GR3034 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40441] GR3034 precursor RNA folds spatially, forming GR3034 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3034 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3034 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence

which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40442] GR3034 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2462 precursor RNA and GAM2463 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40443] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2462 RNA and GAM2463 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40444] GAM2462 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2462 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2462 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2462 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40445] GAM2463 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of

GAM2463 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2463 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2463 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40446] It is appreciated that specific functions, and accordingly utilities, of GR3034 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3034 gene: GAM2462 target protein and GAM2463 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2462 and GAM2463

[40447] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3035 (GR3035) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40448] GR3035 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3035 gene was detected is described hereinabove with reference to Figs. 6-15.

[40449] GR3035 gene encodes GR3035 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40450] GR3035 precursor RNA folds spatially, forming GR3035 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3035 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3035 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40451] GR3035 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2466 precursor RNA and GAM2467 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40452] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2466 RNA and GAM2467 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40453] GAM2466 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2466 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2466 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2466 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40454] GAM2467 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2467 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2467 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2467 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40455] It is appreciated that specific functions, and accordingly utilities, of GR3035 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3035 gene: GAM2466 target protein and GAM2467 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2466 and GAM2467

- [40456] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3036(GR3036) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [40457] GR3036 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3036 gene was detected is described hereinabove with reference to Figs. 6-15.
- [40458] GR3036 gene encodes GR3036 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [40459] GR3036 precursor RNA folds spatially, forming GR3036 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3036 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3036 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.
- [40460] GR3036 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into

at least 2 separate GAM precursor RNAs, GAM2473 precursor RNA and GAM2474 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40461] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2473 RNA and GAM2474 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40462] GAM2473 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2473 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2473 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2473 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40463] GAM2474 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2474 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2474 target RNA, herein schematically

represented by GAM2 TARGET RNA into GAM2474 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40464] It is appreciated that specific functions, and accordingly utilities, of GR3036 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3036 gene: GAM2473 target protein and GAM2474 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2473 and GAM2474

[40465] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3037 (GR3037) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40466] GR3037 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3037 gene was detected is described hereinabove with reference to Figs. 6-15.

[40467] GR3037 gene encodes GR3037 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40468] GR3037 precursor RNA folds spatially, forming GR3037 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3037 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3037 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40469] GR3037 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2478 precursor RNA and GAM2479 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40470] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2478 RNA and GAM2479 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40471] GAM2478 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2478 target RNA, herein schematically represented by GAM1 TARGET

RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2478 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2478 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40472] GAM2479 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2479 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2479 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2479 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40473] It is appreciated that specific functions, and accordingly utilities, of GR3037 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3037 gene: GAM2478 target protein and GAM2479 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2478 and GAM2479

[40474] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3038(GR3038) gene, which encodes an operon-like cluster of novel micro

RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40475] GR3038 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3038 gene was detected is described hereinabove with reference to Figs. 6-15.

[40476] GR3038 gene encodes GR3038 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40477] GR3038 precursor RNA folds spatially, forming GR3038 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3038 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3038 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40478] GR3038 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2480 precursor RNA and GAM2481 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM

precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40479] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2480 RNA and GAM2481 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40480] GAM2480 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2480 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2480 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2480 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40481] GAM2481 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2481 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2481 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2481 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40482] It is appreciated that specific functions, and accordingly utilities, of GR3038

gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3038 gene: GAM2480 target protein and GAM2481 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2480 and GAM2481

[40483] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3039(GR3039) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40484] GR3039 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3039 gene was detected is described hereinabove with reference to Figs. 6-15.

[40485] GR3039 gene encodes GR3039 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40486] GR3039 precursor RNA folds spatially, forming GR3039 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3039 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as

hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3039 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40487] GR3039 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2484 precursor RNA and GAM2485 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40488] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2484 RNA and GAM2485 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40489] GAM2484 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2484 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2484 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2484 target protein, herein

schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40490] GAM2485 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2485 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2485 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2485 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40491] It is appreciated that specific functions, and accordingly utilities, of GR3039 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3039 gene: GAM2484 target protein and GAM2485 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2484 and GAM2485

[40492] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3040 (GR3040) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40493] GR3040 gene, herein designated GR GENE, is a novel bioinformatically

detected regulatory, non protein coding, RNA gene. The method by which GR3040 gene was detected is described hereinabove with reference to Figs. 6-15.

[40494] GR3040 gene encodes GR3040 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40495] GR3040 precursor RNA folds spatially, forming GR3040 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3040 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3040 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40496] GR3040 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2487 precursor RNA and GAM2488 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40497] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in

length, GAM2487 RNA and GAM2488 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40498] GAM2487 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2487 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2487 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2487 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40499] GAM2488 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2488 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2488 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2488 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40500] It is appreciated that specific functions, and accordingly utilities, of GR3040 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3040 gene: GAM2487 target protein and GAM2488 target protein, herein schematically represented by

GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2487 and GAM2488

[40501] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3041 (GR3041) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40502] GR3041 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3041 gene was detected is described hereinabove with reference to Figs. 6-15.

[40503] GR3041 gene encodes GR3041 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40504] GR3041 precursor RNA folds spatially, forming GR3041 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3041 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3041 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half

thereof, as is well known in the art.

- [40505] GR3041 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2493 precursor RNA and GAM2494 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [40506] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2493 RNA and GAM2494 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [40507] GAM2493 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2493 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2493 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2493 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.
- [40508] GAM2494 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2494 target RNA, herein schematically represented by GAM2 TARGET

RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2494 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2494 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40509] It is appreciated that specific functions, and accordingly utilities, of GR3041 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3041 gene: GAM2493 target protein and GAM2494 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2493 and GAM2494

[40510] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3042 (GR3042) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40511] GR3042 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3042 gene was detected is described hereinabove with reference to Figs. 6-15.

[40512] GR3042 gene encodes GR3042 precursor RNA, herein designated GR

PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40513] GR3042 precursor RNA folds spatially, forming GR3042 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3042 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3042 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40514] GR3042 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2513 precursor RNA and GAM2514 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40515] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2513 RNA and GAM2514 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40516] GAM2513 RNA, herein schematically represented by GAM1 binds

complimentarily to a target binding site located in an untranslated region of GAM2513 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2513 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2513 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40517] GAM2514 RNA, herein schematically represented by GAM2 binds complimentarily to a target binding site located in an untranslated region of GAM2514 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2514 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2514 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40518] It is appreciated that specific functions, and accordingly utilities, of GR3042 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3042 gene: GAM2513 target protein and GAM2514 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2513 and GAM2514

[40519] Fig. 16 further provides a conceptual description of novel bioinformatically

detected regulatory gene, referred to here as Genomic Record

3043(GR3043) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40520] GR3043 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3043 gene was detected is described hereinabove with reference to Figs. 6-15.

[40521] GR3043 gene encodes GR3043 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40522] GR3043 precursor RNA folds spatially, forming GR3043 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3043 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3043 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40523] GR3043 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2523 precursor RNA and

GAM2524 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40524] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2523 RNA and GAM2524 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40525] GAM2523 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2523 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2523 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2523 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40526] GAM2524 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2524 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2524 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2524 target protein, herein

schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40527] It is appreciated that specific functions, and accordingly utilities, of GR3043 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3043 gene: GAM2523 target protein and GAM2524 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2523 and GAM2524

[40528] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3044 (GR3044) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40529] GR3044 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3044 gene was detected is described hereinabove with reference to Figs. 6-15.

[40530] GR3044 gene encodes GR3044 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40531] GR3044 precursor RNA folds spatially, forming GR3044 folded precursor

RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3044 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3044 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40532] GR3044 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2532 precursor RNA and GAM2533 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40533] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2532 RNA and GAM2533 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40534] GAM2532 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2532 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2532 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2532 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40535] GAM2533 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2533 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2533 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2533 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40536] It is appreciated that specific functions, and accordingly utilities, of GR3044 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3044 gene: GAM2532 target protein and GAM2533 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2532 and GAM2533

[40537] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3045 (GR3045) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one

target gene, the function and utility of which at least one target gene is known in the art.

[40538] GR3045 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3045 gene was detected is described hereinabove with reference to Figs. 6-15.

[40539] GR3045 gene encodes GR3045 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40540] GR3045 precursor RNA folds spatially, forming GR3045 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3045 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3045 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40541] GR3045 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2535 precursor RNA and GAM2536 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to

## GAM PRECURSOR RNA of Fig. 8.

[40542] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2535 RNA and GAM2536 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40543] GAM2535 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2535 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2535 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2535 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40544] GAM2536 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2536 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2536 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2536 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40545] It is appreciated that specific functions, and accordingly utilities, of GR3045 gene, herein designated GR GENE, correlate with, and may be deduced

from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3045 gene: GAM2535 target protein and GAM2536 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2535 and GAM2536

[40546] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3046(GR3046) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40547] GR3046 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3046 gene was detected is described hereinabove with reference to Figs. 6-15.

[40548] GR3046 gene encodes GR3046 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40549] GR3046 precursor RNA folds spatially, forming GR3046 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3046 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the

nucleotide sequence of GR3046 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40550] GR3046 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2541 precursor RNA and GAM2542 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40551] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2541 RNA and GAM2542 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40552] GAM2541 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2541 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2541 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2541 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40553] GAM2542 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2542 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2542 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2542 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40554] It is appreciated that specific functions, and accordingly utilities, of GR3046 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3046 gene: GAM2541 target protein and GAM2542 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2541 and GAM2542

[40555] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3047 (GR3047) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40556] GR3047 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which

GR3047 gene was detected is described hereinabove with reference to Figs. 6-15.

[40557] GR3047 gene encodes GR3047 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40558] GR3047 precursor RNA folds spatially, forming GR3047 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3047 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3047 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40559] GR3047 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM2543 precursor RNA, GAM2544 precursor RNA and GAM2545 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR and GAM3 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40560] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in

length, GAM2543 RNA, GAM2544 RNA and GAM2545 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA and GAM3 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40561] GAM2543 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2543 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2543 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2543 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40562] GAM2544 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2544 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2544 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2544 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40563] GAM2545 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of GAM2545 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2545 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM2545 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[40564] It is appreciated that specific functions, and accordingly utilities, of GR3047 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3047 gene: GAM2543 target protein, GAM2544 target protein and GAM2545 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2543, GAM2544 and GAM2545

[40565] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3048(GR3048) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40566] GR3048 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3048 gene was detected is described hereinabove with reference to Figs. 6-15.

[40567] GR3048 gene encodes GR3048 precursor RNA, herein designated GR

PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40568] GR3048 precursor RNA folds spatially, forming GR3048 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3048 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3048 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40569] GR3048 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2550 precursor RNA and GAM2551 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40570] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2550 RNA and GAM2551 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40571] GAM2550 RNA, herein schematically represented by GAM1 binds

complimentarily to a target binding site located in an untranslated region of GAM2550 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2550 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2550 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40572] GAM2551 RNA, herein schematically represented by GAM2 binds complimentarily to a target binding site located in an untranslated region of GAM2551 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2551 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2551 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40573] It is appreciated that specific functions, and accordingly utilities, of GR3048 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3048 gene: GAM2550 target protein and GAM2551 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2550 and GAM2551

[40574] Fig. 16 further provides a conceptual description of novel bioinformatically

detected regulatory gene, referred to here as Genomic Record 3049(GR3049) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40575] GR3049 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3049 gene was detected is described hereinabove with reference to Figs. 6-15.

[40576] GR3049 gene encodes GR3049 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40577] GR3049 precursor RNA folds spatially, forming GR3049 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3049 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3049 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40578] GR3049 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2555 precursor RNA and

GAM2556 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40579] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2555 RNA and GAM2556 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40580] GAM2555 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2555 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2555 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2555 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40581] GAM2556 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2556 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2556 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2556 target protein, herein

schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40582] It is appreciated that specific functions, and accordingly utilities, of GR3049 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3049 gene: GAM2555 target protein and GAM2556 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2555 and GAM2556

[40583] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3050 (GR3050) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40584] GR3050 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3050 gene was detected is described hereinabove with reference to Figs. 6-15.

[40585] GR3050 gene encodes GR3050 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40586] GR3050 precursor RNA folds spatially, forming GR3050 folded precursor

RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3050 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3050 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40587] GR3050 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2562 precursor RNA and GAM2563 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40588] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2562 RNA and GAM2563 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40589] GAM2562 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2562 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2562 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2562 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40590] GAM2563 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2563 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2563 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2563 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40591] It is appreciated that specific functions, and accordingly utilities, of GR3050 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3050 gene: GAM2562 target protein and GAM2563 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2562 and GAM2563

[40592] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3051 (GR3051) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one

target gene, the function and utility of which at least one target gene is known in the art.

[40593] GR3051 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3051 gene was detected is described hereinabove with reference to Figs. 6-15.

[40594] GR3051 gene encodes GR3051 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40595] GR3051 precursor RNA folds spatially, forming GR3051 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3051 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3051 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40596] GR3051 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2575 precursor RNA and GAM2576 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to

GAM PRECURSOR RNA of Fig. 8.

[40597] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2575 RNA and GAM2576 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40598] GAM2575 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2575 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2575 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2575 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40599] GAM2576 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2576 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2576 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2576 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40600] It is appreciated that specific functions, and accordingly utilities, of GR3051 gene, herein designated GR GENE, correlate with, and may be deduced

from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3051 gene: GAM2575 target protein and GAM2576 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2575 and GAM2576

[40601] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3052(GR3052) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40602] GR3052 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3052 gene was detected is described hereinabove with reference to Figs. 6-15.

[40603] GR3052 gene encodes GR3052 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40604] GR3052 precursor RNA folds spatially, forming GR3052 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3052 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the

nucleotide sequence of GR3052 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

- [40605] GR3052 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2582 precursor RNA and GAM2583 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [40606] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2582 RNA and GAM2583 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [40607] GAM2582 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2582 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2582 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2582 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40608] GAM2583 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2583 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2583 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2583 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40609] It is appreciated that specific functions, and accordingly utilities, of GR3052 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3052 gene: GAM2582 target protein and GAM2583 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2582 and GAM2583

[40610] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3053 (GR3053) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40611] GR3053 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which

GR3053 gene was detected is described hereinabove with reference to Figs. 6-15.

[40612] GR3053 gene encodes GR3053 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40613] GR3053 precursor RNA folds spatially, forming GR3053 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3053 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3053 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40614] GR3053 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2584 precursor RNA and GAM2585 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40615] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2584 RNA and GAM2585 RNA respectively, herein

schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40616] GAM2584 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2584 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2584 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2584 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40617] GAM2585 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2585 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2585 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2585 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40618] It is appreciated that specific functions, and accordingly utilities, of GR3053 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3053 gene: GAM2584 target protein and GAM2585 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The

function of these target genes is elaborated hereinabove with reference to GAM2584 and GAM2585

- [40619] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3054(GR3054) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [40620] GR3054 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3054 gene was detected is described hereinabove with reference to Figs. 6-15.
- [40621] GR3054 gene encodes GR3054 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [40622] GR3054 precursor RNA folds spatially, forming GR3054 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3054 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3054 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

- [40623] GR3054 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM2586 precursor RNA, GAM2587 precursor RNA and GAM2588 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR and GAM3 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [40624] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2586 RNA, GAM2587 RNA and GAM2588 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA and GAM3 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [40625] GAM2586 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2586 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2586 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2586 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.
- [40626] GAM2587 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of

GAM2587 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2587 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2587 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40627] GAM2588 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of GAM2588 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2588 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM2588 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[40628] It is appreciated that specific functions, and accordingly utilities, of GR3054 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3054 gene: GAM2586 target protein, GAM2587 target protein and GAM2588 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2586, GAM2587 and GAM2588

[40629] Fig. 16 further provides a conceptual description of novel bioinformatically

detected regulatory gene, referred to here as Genomic Record 3055(GR3055) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40630] GR3055 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3055 gene was detected is described hereinabove with reference to Figs. 6-15.

[40631] GR3055 gene encodes GR3055 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40632] GR3055 precursor RNA folds spatially, forming GR3055 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3055 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3055 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40633] GR3055 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2591 precursor RNA and

GAM2592 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40634] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2591 RNA and GAM2592 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40635] GAM2591 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2591 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2591 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2591 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40636] GAM2592 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2592 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2592 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2592 target protein, herein

schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40637] It is appreciated that specific functions, and accordingly utilities, of GR3055 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3055 gene: GAM2591 target protein and GAM2592 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2591 and GAM2592

[40638] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3056 (GR3056) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40639] GR3056 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3056 gene was detected is described hereinabove with reference to Figs. 6-15.

[40640] GR3056 gene encodes GR3056 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40641] GR3056 precursor RNA folds spatially, forming GR3056 folded precursor

RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3056 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3056 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40642] GR3056 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2606 precursor RNA and GAM2607 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40643] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2606 RNA and GAM2607 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40644] GAM2606 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2606 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2606 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2606 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40645] GAM2607 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2607 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2607 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2607 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40646] It is appreciated that specific functions, and accordingly utilities, of GR3056 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3056 gene: GAM2606 target protein and GAM2607 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2606 and GAM2607

[40647] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3057 (GR3057) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one

target gene, the function and utility of which at least one target gene is known in the art.

[40648] GR3057 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3057 gene was detected is described hereinabove with reference to Figs. 6-15.

[40649] GR3057 gene encodes GR3057 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40650] GR3057 precursor RNA folds spatially, forming GR3057 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3057 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3057 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40651] GR3057 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2608 precursor RNA and GAM2609 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to

GAM PRECURSOR RNA of Fig. 8.

[40652] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2608 RNA and GAM2609 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40653] GAM2608 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2608 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2608 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2608 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40654] GAM2609 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2609 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2609 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2609 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40655] It is appreciated that specific functions, and accordingly utilities, of GR3057 gene, herein designated GR GENE, correlate with, and may be deduced

from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3057 gene: GAM2608 target protein and GAM2609 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2608 and GAM2609

[40656] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3058 (GR3058) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40657] GR3058 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3058 gene was detected is described hereinabove with reference to Figs. 6-15.

[40658] GR3058 gene encodes GR3058 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40659] GR3058 precursor RNA folds spatially, forming GR3058 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3058 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the

nucleotide sequence of GR3058 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

- [40660] GR3058 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2618 precursor RNA and GAM2619 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [40661] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2618 RNA and GAM2619 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [40662] GAM2618 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2618 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2618 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2618 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40663] GAM2619 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2619 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2619 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2619 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40664] It is appreciated that specific functions, and accordingly utilities, of GR3058 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3058 gene: GAM2618 target protein and GAM2619 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2618 and GAM2619

[40665] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3059 (GR3059) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[40666] GR3059 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which

GR3059 gene was detected is described hereinabove with reference to Figs. 6-15.

[40667] GR3059 gene encodes GR3059 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[40668] GR3059 precursor RNA folds spatially, forming GR3059 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3059 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3059 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[40669] GR3059 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2623 precursor RNA and GAM2624 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[40670] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2623 RNA and GAM2624 RNA respectively, herein

schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[40671] GAM2623 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2623 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2623 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2623 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[40672] GAM2624 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM2624 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2624 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2624 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40673] It is appreciated that specific functions, and accordingly utilities, of GR3059 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3059 gene: GAM2623 target protein and GAM2624 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The

function of these target genes is elaborated hereinabove with reference to GAM2623 and GAM2624

- [40674] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 3060(GR3060) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [40675] GR3060 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR3060 gene was detected is described hereinabove with reference to Figs. 6-15.
- [40676] GR3060 gene encodes GR3060 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [40677] GR3060 precursor RNA folds spatially, forming GR3060 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR3060 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR3060 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

- [40678] GR3060 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 4 separate GAM precursor RNAs, GAM2633 precursor RNA, GAM2634 precursor RNA, GAM2635 precursor RNA and GAM2636 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR, GAM3 PRECURSOR and GAM4 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [40679] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2633 RNA, GAM2634 RNA, GAM2635 RNA and GAM2636 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA, GAM3 RNA and GAM4 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [40680] GAM2633 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM2633 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2633 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM2633 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.
- [40681] GAM2634 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of

GAM2634 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2634 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM2634 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[40682] GAM2635 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of GAM2635 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2635 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM2635 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[40683] GAM2636 RNA, herein schematically represented by GAM4 binds complementarily to a target binding site located in an untranslated region of GAM2636 target RNA, herein schematically represented by GAM4 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2636 target RNA, herein schematically represented by GAM4 TARGET RNA into GAM2636 target protein, herein schematically represented by GAM4 TARGET PROTEIN, both of Fig. 8.

[40684] It is appreciated that specific functions, and accordingly utilities, of GR3060 gene, herein designated GR GENE, correlate with, and may be deduced

from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR3060 gene: GAM2633 target protein, GAM2634 target protein, GAM2635 target protein and GAM2636 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM2633, GAM2634, GAM2635 and GAM2636.

#### [40685] BIBLIOGRAPHY

[40686] It is appreciated by persons skilled in the art that the present invention is not limited by what has been particularly shown and described hereinabove.

Rather the scope of the present invention includes both combinations and subcombinations of the various features described hereinabove as well as variations and modifications which would occur to persons skilled in the art upon reading the specifications and which are not in the prior art.
